| Total:                  | 1,935                   | 3,240   | 4,900   | 1,742   | 2,145                  | 3,288   | 9,189      | 10,455     | 10,455                             | 12,788     |  |

in the first year, rising gradually to 2½ per cent in 1961, 3 per cent in 1962 and to the maximum of 4 per cent in 1963, the last complete year of operations. Critics questioned the need for such an institution as a separate entity but the U.S. Aid Mission, it appears, was eager to place Rs. 26 crores of counterpart funds at the disposal of private industry through private financial agencies. In 1957, the resources of banks were under heavy strain and their borrowing from the Reserve Bank had reached what they believed was the prudent limit. The Government did not want to place a large volume of P.L. 480 funds directly with private banks. By the time the compromise proposition in the form of this Corporation got through, the banks recovered their liquidity, mainly through a large influx of deposits and also through some easing of the demand for credit. This quasi-private institution always worked as a department of the Reserve Bank without any establishment of its own.

Monetary stringency after 1960 and successive steps to relax its lending terms and scope of activities brought about a considerable and useful enlargement of the Corporation's operations through 1964. Initially, it could only refinance the medium term bills of member banks upto a limit of Rs. 50 lakhs drawn by industrial concerns whose paid up capital and reserves did not exceed Rs. 2.50 crores. Later, all scheduled banks were made eligible for such assistance and in 1962, S.F.Cs. also were permitted to approach the Corporation on similar terms. With effect from January 1963, the Corporation was designated as the authority for refinancing of medium term export credits. It also took up the scheme of guarantee of rupee loans by banks and financial institutions to coal companies for their expansion, the foreign exchange for which was provided by a World Bank Loan.

Through 1963, the Corporation received 422 applications for a total assistance of Rs. 63.70 crores, of which 335 applications for Rs. 51.11 crores were sanctioned, and Rs. 28.09 crores was disbursed. Most of the assistance went to new industries like metals, engineering and chemicals but traditional industries like sugar and textiles received about one-third of the total amount sanctioned. Almost one-half of the total assistance disbursed was absorbed in 1963 alone. The effective sanction of Rs. 45 crores at the end of 1963 related to private projects scheduled to cost Rs. 140 crores in the aggregate, of which the Corporation's assistance amounted to 32 per cent.

The Corporation was merged in the newly created Industrial Development Bank in September 1964. The pace of operations picked up further in that year partly because the terms of lending were liberalized further towards the end of August. The limit of refinance in respect of any single unit was raised from Rs. 50 lakhs of total amount sanctioned to Rs. 1 crore of outstanding loan amount, and applications

for still larger amounts were made subject to consideration. Borrowers with paid up capital and reserves of more than Rs. 2.5 crores were also made eligible and term lending institutions (like I.F.C., S.F.Cs, etc.) were permitted to seek refinance for periods longer than 10 years. At the same time, refinance was restricted to 80 per cent instead of 100 per cent of the amount offered for refinance. In 1964, disbursement rose 62 per cent over the previous year's level to Rs. 21.34 crores. Total sanctions from 1958 through 1964 amounted to Rs. 73.77 crores and total disbursements Rs. 49.43 crores, of which Rs. 42.16 crores was outstanding, Rs. 34.46 crores from commercial banks and the rest from other financial institutions.

The lending rate of the Corporation was 5 per cent from inception till March 1963, when it was raised to 5.5 per cent. The concessional rate for export credit was reduced from 5 per cent to 4.5 per cent in December 1963, on condition that the banks charged no more than 6 per cent.

Under the coal loans guarantee scheme introduced in April 1963, 44 applications for Rs. 4.8 crores were received from eleven credit institu-

\*Including Rs. 281 lakhs rejected, Rs. 30 lakhs ineligible for refinance, and Rs. 312 lakhs withdrawn, making a total of Rs. 623 lakhs.

\*\*Including Rs. 595 lakhs ineffective.

\*\*\*Including Rs. 3 lakhs ineffective.

tions. Of these, 32 guarantees for Rs. 3.1 crores were issued till the end of 1964. The losses, if any, on the guarantee are shared between Government and lending institutions in the ratio of 65 : 35.

**National Industrial Development Corporation:** The National Industrial Development Corporation (N.I.D.C.) was set up in October 1954 as a joint stock company wholly owned by the Central Government. It was to act, in effect, within the (then) Ministry of Commerce and Industry more as a development corporation than as a development bank. Its functions were twofold: (i) the study, appraisal and promotion of new projects, both public and private, to fill gaps in the industrial structure; and (ii) financing the rehabilitation of joint stock cotton and jute mills, to which the development of machine tool industry was added later. The authorized share capital was Rs. 1 crore but the paid up capital in March 1964, when its activities practically came to an end, was Rs. 50 lakhs after being raised in successive stages from the initial capital of Rs. 10 lakhs. The increase in capital enabled the Corporation to invest in its subsidiary, Pyrites and Chemicals Development; when this company ceased to be a subsidiary in 1964, the share capital of N.I.D.C. was sought to be reduced to the original Rs. 10 lakhs. In 1963, Government placed a moratorium on fresh loan appraisals by N.I.D.C.

The share capital of N.I.D.C. was kept low since performance of the first function was financed out of Government grants, and the second from Government loans which were re-lent to approved concerns. The Development Wing (now the Department of Technical Development), then within the same Ministry, actually handled most of the work connected with the promotional function and got reimbursed by N.I.D.C. which in turn recovered the expense from Government grants. Preliminary and promotional work of this nature in the name of N.I.D.C. was carried out for the basic chemicals and intermediates plant at Panvel (Maharashtra), raw films project in Mysore (Karnatak), drugs projects with Soviet aid, the heavy engineering and mining machinery projects with Soviet and Czech aid, and certain other heavy engineering projects (structurals and plates and vessels, etc.). It also worked on proposals for carbon black, newsprint from bagasse, sulphur from pyrites, precision instruments, compressors and pumps, aluminium and rayon pulp, etc. N.I.D.C.'s own contribution in this field started only with the setting up of its Technological Consultancy Bureau in 1961 to provide design and consultancy services.

N.I.D.C. loans were on easy terms; it could accept a second mortgage, lend up 80 and 50 per cent, respectively, of the unencumbered value of fixed assets against first and second mortgages, and it charged lower interest rates than other institutions but its loans were repayable over 10 to 15 years. As of March 1964, it had sanctioned 114 applications

for loans aggregating Rs. 28.19 crores, mostly to cotton mills, and disbursed Rs. 14.86 crores, of which approximately Rs. 11 crores was outstanding. The whole of the outstanding amount was financed by unsecured loans from Government.

TABLE LXXXII  
N.I.D.C. Loans 1954-64

(Amounts in Rs. lakhs)

|                          |      | Cotton | Jute  | Machine tools | Total  |
|--------------------------|------|--------|-------|---------------|--------|
| 1. Applications received | No.  | 157    | 78    | 5             | 240    |
|                          | Amt. | 7,312  | 2,127 | 106           | 9,545* |
| 2. Applications approved | No.  | 67     | 48    | 4             | 114    |
|                          | Amt. | 1,965  | 754   | 100           | 2,819  |
| 3. Loans disbursed       | Amt. | 841    | 557   | 88            | 1,486  |

\*Including rejections of Rs. 21.39 lakhs and Rs. 27.84 lakhs withdrawn.

In 1964, the lending functions of N.I.D.C. were transferred first to I.F.C. and then to I.D.B. Technical Consultancy Bureau continues to provide its services both in the country and abroad. The range of its consultant engineering services covers detailed designs of projects, preparation of project reports, pre-investment and feasibility studies and technical and economic evaluation of schemes. In addition the Corporation has developed a Documentation Centre equipped with price indices for machinery equipment, wage levels, construction costs etc., to assist banks and financial institutions in evaluating loan applications for industrial projects and schemes.

The earnings from consultancy services over a five year period increased by Rs. 47 lakhs to Rs. 69.00 lakhs in 1969-70. Foreign exchange earnings for its services abroad were valued at Rs. 10 lakhs as against Rs. 6 lakhs in the previous year.

The N.I.D.C. acts as the agency of the Government of India for the grant of loans to cotton textile and jute industries for the purpose of rehabilitation and modernization of machinery and to machine tool units for expansion and rehabilitation.

**Industrial Development Bank of India:** The Industrial Development Bank of India was established as a statutory body on July 1, 1964. It is a wholly owned subsidiary of the Reserve Bank of India. Its functions are.

- (i) to act as an apex industrial finance institution for refinancing the institutions already in existence,
- (ii) to provide direct financial assistance of all kinds to industrial concerns, defined to include manufacturing and processing, shipping, mining, hotel, transport and power undertakings, and

- (iii) to refinance credits extended by commercial banks to industrial borrowers.

It can undertake research and surveys for evaluating and dealing with marketing or investments, carry out techno-economic industrial studies, provide technical and administrative services to industry, plan, promote and develop industries to fill up gaps in the industrial structure, from subsidiaries *and do any other business* which Government, on the recommendation of the Reserve Bank, may authorize. In a word, it is expected to see that no worthwhile priority project suffers for lack of funds. It has been endowed with adequate potential resources and operational flexibility.

**Apex Role and Co-ordination:** The I.D.B.I., through a variety of mechanism, functions as an apex bank and a co-ordinator of institutional activities in the development of finance for industry. On the one hand, it has granted substantial financial assistance besides assuming the role of leadership in several cases. Because of technological compulsions, certain projects have to be large ones in which investment is substantial. For example, six major fertilizer projects, two cement expansion schemes, four petro-chemical projects, an alloy steel plant and two aluminium projects have received assistance.

As co-ordinator, on the other hand, it holds a monthly Inter-Institutional Meeting at which the Life Insurance Corporation of India, the Unit Trust of India, the Industrial Finance Corporation of India and the Industrial Credit and Investment Corporation of India are represented. At these meetings, broad policies in project financing are discussed and co-ordinated and proposals are considered for financial and technical assistance on a consortium basis for large and medium industries.

In respect of small project all over the country, I.D.B.I. fulfils its role of purveyor of supplementary resources and co-ordinator — through refinancing of industrial loans and rediscounting of machinery bills. It has also been giving direct assistance to comparatively small projects where the talents of technician-*entrepreneurs* come into play. Textiles, fertilizers, electronics and light engineering industries are some that have been given direct assistance. These schemes have enabled the Bank to facilitate industrialization in many places.

In the field of medium and long term export financing for engineering goods, I.D.B.I. again has been playing a dual role through its scheme of refinancing assistance by banks as well as direct participation with the banks in providing export finance.

Further, I.D.B.I. has been taking a hand in strengthening the financial structure of State Finance Corporations and the other loan lending institutions like I.F.C.I. and I.C.I.C.I. through subscriptions to their bonds and shares.

The authorized share capital is Rs. 50 crores which can be increased by the Reserve Bank with prior Government permission to Rs. 100 crores. Paid up capital in the first instance was Rs. 10 crores and was increased to Rs. 30 crores in January 1971. The Central budget in 1965-66 provided for a Government loan of Rs. 45 crores. It can borrow, free of interest, Rs. 10 crores from Government, repayable over 30 years, repayment commencing 15 years after the date of receipt, and can get further loans from Government as and when required. Net borrowings at the end of June 1971 stood at Rs. 146.7 crores. It can issue bonds with or without Government guarantee, borrow from any approved institutions in India, accept long term deposits and receive foreign currency loans with prior Government permission. It can borrow from the Reserve Bank (i) against trustee securities for ninety days, (ii) against genuine commercial bills for 5 years and (iii) out of the National Industrial Credit (Long Term Operations) Fund. The N.I.C. Fund was simultaneously established at the Reserve Bank with an initial sum of Rs. 10 crores, which now amounts to Rs. 80 crores. The Fund is used exclusively for the purchase of I.D.B.I. bonds and loans to I.D.B.I. for its purchase of shares and bonds of financial institutions.

TABLE LXXXIII  
Principal Sources of Funds  
1964-1971

(Rs. in crores)

| No.                                                     | Source                                          | Amount | Percentage to total |
|---------------------------------------------------------|-------------------------------------------------|--------|---------------------|
| 1.                                                      | Increase in paid up capital and reserve/surplus | 48.2   | 12.1                |
| 2.                                                      | Borrowings from Government                      | 145.0* | 36.4                |
| 3.                                                      | Borrowings from Reserve Bank                    | 55.0   | 13.8                |
| 4.                                                      | Borrowings by way of debentures                 | —**    | —                   |
| 5.                                                      | Repayment of assistance                         | 137.0  | 34.4                |
| 6.                                                      | Sale of investment                              | 2.7    | 0.7                 |
| Total (including cash/liquid resources and other items) |                                                 | 398.2  | 100.0               |

\*Includes Rs. 1 crore borrowed by R.C.I. between July and August 1964 but excluding Rs. 32.5 crores borrowed by it upto the end of June 1964.

\*\*I.D.B.I. has provided for Rs. 15.0 crores in 1971-72 estimated.

I.D.B.I. has set up a Development Assistance Fund as required in the Act. Assistance out of this Fund would be extended to high priority industrial concerns with prior Government permission which cannot raise funds in the normal course. This revolving fund is built up through Government loans and grants. Since its establishment on March 27, 1965 with a token amount of Rs. 1 lakh, the fund now totals Rs. 27.9 crores and its profits stood at Rs. 98 lakhs in 1970-71.

During the first six months of operations from July to December 1964, I.D.B.I. sanctioned 10 applications, all for underwriting, with a total

mitment of Rs. 1.15 crores but no amount was disbursed. Its first ventures have been in underwriting because I.F.C. is traditionally chary of such activity and its experience of such activity after taking it up at a late stage has not been too happy due to the state of the capital market, while I.C.I.C.I. has been tending to run short of rupee funds. Participation of brokers and other private agencies is being deliberately encouraged and organized by giving them a share in I.D.B.I.'s own underwriting commission in order to broaden the base of the capital market. No direct loans were sanctioned during the first six months.

During the year as a whole, the total sanctions amounted to Rs. 44.5 crores. This was exclusive of guarantees but inclusive of direct loans and underwritings (47.4%), refinance of industrial loans (47.0%), subscription to shares and bonds of financial institutions (4.9%), export-finance (0.5%) and rediscounting of machinery bills (0.2%). Cash disbursements were Rs. 23.9 crores.

Since its inception till the end of June, 1971, I.D.B.I. sanctioned assistance to 3,706 units amounting to Rs. 466.2 crores. Disbursements totalled Rs. 358.4 crores. This excludes subscriptions to the shares of I.F.C.I. and the newly created Industrial Reconstruction Corporation of India.

TABLE LXXXIV  
I.D.B.I. Operations from 1964 to June 1971

(In Rs. crores)

| No. | Type of Assistance                                               | Units | Sanctions | Disbursements |
|-----|------------------------------------------------------------------|-------|-----------|---------------|
| 1.  | Direct loans to industrial concerns (other than for exports)     | 112   | 148.1     | 89.6          |
| 2.  | Underwriting of and direct subscription to shares and debentures | 103   | 28.5      | 19.6          |
| 3.  | Refinance of industrial loans                                    | 3,188 | 123.3     | 118.1         |
| 4.  | Rediscounting of bills                                           | 209   | 89.9      | 77.0          |
|     |                                                                  | 3,612 | 389.8     | 304.3         |
| 5.  | Direct loans for exports                                         | 32    | 29.1      | 14.9          |
| 6.  | Refinance of export credits                                      | 45    | 24.0      | 16.6          |
|     | Total:                                                           | 3,689 | 442.9     | 335.8         |
| 7.  | Subscriptions to shares and loans of financial institutions      | 17    | 23.3      | 22.6          |
|     | Total 1 to 7                                                     | 3,706 | 466.2     | 358.4         |
| 8.  | Guarantees for loans and deferred payments                       | 14    | 29.3      | 19.1          |
| 9.  | Export guarantees                                                | 3     | 1.7       | 1.6           |

Since the bank started its operations, there has been, over the years, some shift in the composition of I.D.B.I. assistance from direct financing of industrial concerns (other than for exports) to channelizing of finance through the intermediary of other financial institutions as well as direct

assistance for exports in participation with banks. The substantial assistance in the form of refinance, and subscription to bonds and shares of other financial institutions that the I.D.B.I. now extends, emphasizes its growing responsibility as an apex institution in this field. This role as a catalytic agent would continue to grow in the future in promoting and financing industrial development in the backward regions.

The rate of interest charged by I.D.B.I. is  $8\frac{1}{2}$  per cent on direct loans, 6.75 to 7% on refinance, rediscounting of bills 5 to 6 per cent, export credit refinance against medium term export credits — 4.5 per cent.

**Organization and Management:** Management is vested in a Board of Directors, same as that of the Reserve Bank. The Governor is Chairman and one of the Deputy Governors is Vice-Chairman. Actual superintendence and management are vested in an Executive Committee of the Board, consisting of ten members including the Chairman and Vice-Chairman who meet once a month. Project applications are appraised by *ad hoc* groups, one for each project, consisting of technical, financial and managerial experts drawn from a panel of specialists working in public and private enterprises. The Deputy Chairman heads each *ad hoc* group. This procedure, which differs from that both I.F.C. and I.C.I.C.I., has, according to the Bank, proved efficient, quick and satisfactory during the limited period for which it has been in existence.

With the establishment of I.D.B.I., the share capital of I.F.C. was raised from Rs. 7 crores to Rs. 8.35 crores. The entire additional share capital, together with the shares held by Government and the Reserve Bank, were transferred to I.D.B. to enable it to hold 50 per cent of the total share capital. The power to issue directives to I.F.C. has also been transferred from Government to I.D.B. These changes notwithstanding, I.F.C. remains as autonomous and distinctly separate organization.

Under its charter, I.D.B. can lend to other financial institutions only through refinance of their loans which are repayable on the expiry of not less than three years and not more than 25 years, or by subscribing to their bonds and share capital. Ultimately, I.D.B. will entirely replace Government as a source of rupee funds but the transition will be smooth.

**I.D.B.'s Promotional Functions:** In order to develop live and intimate contact with the economic situation and potentialities in different regions in the country, the Bank took the first step. The Bank established three Regional Offices, at Madras in South, Calcutta in the east and New Delhi in the north with a committee for each. In the west the Regional Committee will function in Bombay.

A Committee of Directors comprising senior officials of the I.D.B.I., I.C.I.C.I., the Agricultural Refinance Corporation and of the Reserve

Bankhas been set up to initiate surveys of industrial possibilities in relatively backward States. The next step will be to discuss the project ideas that have emerged from the surveys with the State Governments concerned. The other steps relate to identification and search for *entrepreneurs*, preparation of detailed project reports and actual implementation of such projects with the technical and financial assistance of financial institutions. Towards this end, a move has been initiated to bring together State level institutions like the S.F.C.S., S.I.D.C./S.I.I.C., the "lead" banks in the States, Industries Department of State Governments and the All-India term-lending institutions such as I.F.C.I., I.C.I.C.I., and the A.R.C. under the leadership of I.D.B.I. to form an Inter-Institutional Group to further facilitate this work, a jointly sponsored and financial Technical Consultancy Service Centre (TCSC) for each State.

TABLE LXXXV

Classification of Export Finance\* Sanctioned by the I.D.B.I. upto the end of June 1971 according to Destination of Exports and Commodity Exported

(Rupees in crores)

| Name of the country   | Value of Exports financed by I.D.B.I./banks | Amount of I.D.B.I. assistance | Commodity                               |                   |                                               |                         |
|-----------------------|---------------------------------------------|-------------------------------|-----------------------------------------|-------------------|-----------------------------------------------|-------------------------|
|                       |                                             |                               | Transmission line towers and conductors | Textile machinery | Steel rails, bars and railway track equipment | Steel construction aids |
| 1                     | 2                                           | 3                             | 4                                       | 5                 | 6                                             | 7                       |
| Iran                  | 37.0                                        | 20.8                          | 11.9                                    | —                 | 6.4                                           | —                       |

**Unit Trust of India:** The Unit Trust of India was set up on February 1, 1964 as a statutory body. As laid down in the Act, the Reserve Bank has contributed one-half of the initial capital of Rs 5 crores, L.I.C. Rs. 75 lakhs, the State Bank of India and its subsidiaries another Rs. 75 lakhs, and 30 other scheduled banks, Rs. 66 lakhs. By affording the relatively small investors a means of acquiring a share in industrial development at minimum risk and at a reasonable return, the Trust is expected to tap a significant volume of savings which may not have otherwise sought employment in industrial investment.

The sale of Trust Units commenced on July 1, 1964. The first year's sales amounted Rs. 19.1 crores. Repurchases were Rs. 41 lakhs. Together with the initial capital of Rs. 5 crores, a sum of Rs. 24 crores was available with the Trust for disposal.

In the seventh year of its operations, sales during the year ended June 30, 1971 totalled Rs. 18 crores. Less repurchases, the net investment was Rs. 14.80 crores. Sales in the previous year were higher by Rs 4.84 crores and repurchases were also less by Rs, 1.16 crores. The sales in 1970-71 were, however, higher than those in any of the earlier year, 1965-66 upto 1968-69.

The modest setback in 1970-71 reflected mainly the hardening of interest rates in the economy which resulted in the upward revision in the pattern of yields in the market, increase in the interest rates in rival channels of investment and also the change in the scheme of tax concessions.

The aggregate value of units sold and outstanding as on June 30, 1971 was over Rs. 92.25 crores. The total number of unit holders registered with the Trust were more than 3,80,000. In 1970-71, almost the whole of the investments in Units was by individuals who accounted for Rs 17.36 crores. Institutions invested Rs 63.50 lakhs only.

The Trust has introduced four schemes to popularize investment in units among different segments of the community. These are the

Note: (1) Classification based on location of projects assisted in each State. In a few cases, assistance was sanctioned for expansion of existing units/setup up of new units in more than one State; such assistance has been included in the State where the assistance has gone predominantly. In the case of rediscounts, the classification is based on the location of machinery manufacturer/seller.

(2) Figures are exclusive of subscriptions to shares and bonds of financial institutions.

\*Inclusive of disbursements in respect of refinance sanctioned by the Refinance Corporation for Industry Ltd. prior to its merger with the I.D.B.I. in September 1964

Reinvestment Plan 1966, the Voluntary Savings Plan 1969, the Children's Gift Plan 1970 and the latest Unit Linked Insurance Plan 1971.

**Investments:** The total investments of the Trust as on June 30, 1971 were Rs. 105.14 crores, an increase of Rs. 16.96 crores over the previous year. There has been no significant change in the pattern of investments which continues to reflect the overall investment objectives of the Unit Scheme 1964—safety of capital and a regular and growing income.

TABLE LXXXIX

Pattern of Overall Unit Trust Investment from 1964 to June 30, 1971

(Rs in crores)

| Type of investment                                                 | Investment<br>1964-65 | %age of<br>total | Investment<br>1970-71 | %age of<br>total |
|--------------------------------------------------------------------|-----------------------|------------------|-----------------------|------------------|
| 1. Ordinary shares                                                 | 8.67                  | 35.5             | 39.66                 | 37.7             |
| 2. Preference shares                                               | 1.76                  | 7.2              | 13.08                 | 12.4             |

Note : \*Less than Rs. 5 lakhs

\*\*Less than 0.05 per cent.

\*\*\*Inclusive of stamp duties, commission, transfer fees etc. capitalized.

Certain guidelines have been provided for the regulation of investments. The Trust's investment in any one company is not to exceed 5 per cent of the Trust's total investible funds or 10 per cent of the securities issued by the company and outstanding, whichever is lower. Not more than 5 per cent of the investible funds can be invested in the initial issues of new industrial undertakings, i.e. investments which do not yield any current income.

The expenses and total gross income of the Trust are allocated between the initial and unit capital on the basis of the proportion which each bears to the other at the end of the accounting year, but the expenses charged to unit capital earnings are not to exceed 5 per cent of the earnings. At least 90 per cent of the net income earned by unit capital has to be distributed to unit holders. The income of the Trust is entirely tax free and dividend together with income from certain specified securities upto an amount of Rs. 3,000 to an individual is also free of income tax.

All scheduled banks which have contributed to the initial capital of the Trust act as agents for receiving applications and monies for the purchase of units. The Trust has emerged as one of the leading buyers of debentures since it began operations in June 1964, when investment in debentures accounted for the largest percentage (9.93) of the Trust's total investment. In 1970-71 debentures continued to remain at the top places with Rs. 40.89 crores making 38.9% of total investments for the year. Besides underwriting fresh issues, it has also purchased debentures in the open market, mainly from banks to help them release funds for industrial advances.

The management of the Trust is vested in a board of trustees which is required to 'Act on Business principals, regard being paid to the interest of the unit holder'. There is no explicit reference to the public interest as in the charters of L.I.C., I.F.C., etc. Of the ten trustees, the chairman, executive trustee and four other trustees are nominated by the Reserve Bank, one each by L.I.C. and the State Bank of India, and the remaining two by other contributors to the initial capital. The board has to meet at least once every two months but routine work is carried on by an executive committee, consisting of the Chairman, executive trustee and to other trustees nominated by the Reserve Bank. The Reserve Bank, and not Government, has the power to issue policy directives to the Trust.

The business of the Trust is restricted to sale and purchase of units, with a minimum face value of Rs. 10 and maximum of Rs. 100, investment in securities, and keeping deposits with scheduled banks. It is authorized to borrow monies in any form and from any institution, and from the Reserve Bank for ninety days against trustee securities.

**Industrial Reconstruction Corporation of India:** Several industrial units, especially in the Eastern Region have been facing difficulties and some have even stopped functioning. They have to be rehabilitated because of their importance to the national economy and the needs of employment of a large work force.

At the invitation of the I.D.B.I., the Industrial Reconstruction Corporation of India (I.R.C.I.) was set up in April 1971, under the Companies

Act with headquarters at Calcutta. To begin with, the I.R.C.I. will deal with urgent industrial problems of Calcutta and the Eastern Region especially, problems of rehabilitation and revival of 'sick' and closed industrial units. A major part of its work is likely to be to provide risk and loan capital on soft terms so as to enable the closed units to restart soon.

The Corporation's other activities would include restructuring of companies, labour management problems, change in product mix and related matters. It may also have to encourage, promote, assist and finance merger, amalgamation or reconstruction of industrial undertakings and change of management in appropriate cases and take all such action that will revive industrial development.

The authorized capital of the Corporation is Rs. 25 crores. Its issued capital is Rs. 10 crores and paid up capital Rs. 2.50 crores. This paid up capital is held by I.D.B.I., I.F.C.I., L.I.C.I., I.C.I.C.I., the State Bank of India and the 14 nationalized banks. It will also receive loans from the Government of India on soft terms.

The Corporation has received 85 applications for assistance aggregating Rs. 6.99 crores. Sanctions upto June 1971 amounted to Rs. 1.05 crores for six industrial units, two each in the textile and engineering groups and one each in the mining and foundry industries.

### IX. -- Foreign Aid and Investment

External financial assistance to industry takes three forms: (1) official assistance, *i.e.* loans from foreign Governments and international institutions, (2) investment by foreign private investors in Indian enterprises, and (3) supplier credits or deferred payments facilities for import of equipment. There is also supply of technical assistance and know-how which goes under the generic label of technical collaboration. Since industrial enterprise is an intrinsically commercial proposition, it does not normally qualify for grants or interest-free loans or cheap long term loans.

**Official Assistance:** Upto the end of 1969-70, India was sanctioned total external loans of Rs 6.662.5 crores, of which Rs. 4,742.7 crores or more than two-thirds was almost directly for industrial development. The principal sources of loans were U.S.A., U.S.S.R., West Germany, U.K., and the World Bank.

**Foreign Investment in India:** Total foreign investment in India in the corporate sector (including State enterprises) as of June 1948, which was estimated by the Reserve Bank of India for the first time, amounted to Rs. 265 crores, wholly from private sources. It rose to Rs. 563 crores

TABLE LXXXXI

(Rs. in crores)

52.2 crores to Rs. 122.5 crores, while that in petroleum went up nearly nine times from Rs. 22.3 crores to Rs. 196.4 crores and constituted the largest single item of investment, manufacturing industries recorded the highest rate, nearly 12 per cent — from Rs. 70.7 crores to Rs. 821.6 crores. Services accounted for Rs. 107.9 crores in 1948 and Rs. 392.7 crores in 1968.

The main contributors were nine countries with the United Kingdom continuing to remain the largest single investor. It accounted for Rs. 625 crores or 40 per cent of the total foreign investments in corporate enterprises together with all suppliers' credits at the end of March 1968 a year earlier, Britain's share was 44 per cent but the decline was due to devaluation of the sterling in November 1967 and a sharp reduction from Rs. 38 crores in 1966-67 to Rs. 2 crores in 1967-68 in the net inflow of capital from this country. Gross private other capital rose to Rs. 41 crores in 1966-67 and declined to Rs. 7 crores the following year.

The U.K. again headed the list in direct investments with Rs. 505 crores or 72 per cent. Its other private capital was Rs. 120 crores which was 25 per cent of the total other capital. Almost, the whole of the foreign investments in plantations in India came from Britain, mainly in branches of sterling tea companies. These accounted for 19 per cent of Britain's total investments and 23 per cent of its direct investments. Manufacturing accounted for 45 per cent of Britain's total investment in India, petroleum 17 per cent and service industries 18 per cent.

Next comes the U.S.A. with Rs. 422 crores or 27 per cent of the total foreign investments. Its investments rose by Rs. 47 crores in 1967-68 as against Rs. 67 crores in the previous year. The decline was mainly due to a fall in drainings on loans from official sources. The net inflow of direct investment and other capital increased by about Rs. 10 crores and Rs. one crore respectively. Of the total investments from U.S.A. at the end of March 1968, direct investments were 26 per cent, loan capital from U.S.AID and EXIM Bank 53 per cent and other capital from private sources 21 per cent. Sixty-four per cent (Rs. 273 crores) of U.S. investments, were in manufacturing industries, Rs. 70 crores in petroleum and Rs. 79 crores in services industries.

As at the end of March 1968, West Germany's investments in India stood at Rs. 100 crores or 7 per cent of all foreign investments in India. The net inflow declined from Rs. 28 crores in the previous year to Rs. 15 crores. The decline was mainly due to reduced gross inflow of supplier's credit and loans. Direct investments from West Germany totalled Rs. 16 crores; Rs. 55 crores came as capital from private sources and Rs. 29 crores from the German Kreditaustalt. About 44 per cent of West Germany's total investments were in the manufacturing industries and the balance in the services industries, mainly shipping and in officially organized financial institutions.

The share of International Institutions, the World Bank and the International Finance Corporation fell by one per cent in 1967-68. This was because of larger amortization payments which more than off set the inflow. The outstanding liabilities to these institutions aggregated Rs. 98 crores and represented 27 per cent of loans and credits from official sources. About 59 per cent of the investments by these institutions were in the service industries — power projects and in financial institutions and the rest in the manufacturing industries mainly iron and steel.

Japanese investments increased by Rs. 17 crores totalling Rs. 82 crores representing 5 per cent of the total foreign investments in India, almost the whole of the net inflow came as suppliers' credit. Similarly, inflows from Italy (Rs. 4 crores) and France (Rs. 2 crores) were suppliers' credits. Among the other countries net inflow from Sweden, Belgium and the Netherlands aggregating Rs. 13 crores was largely suppliers' credits and Rs. 3 crores from Switzerland was mainly in the form of direct investment.

Industry-wise, Rs. 822 crores or 53 per cent of the total investments in India plus all suppliers' credits as at the end of March 1968 went to the manufacturing group. Chemicals and allied products accounted for Rs. 54 crores. Investments in petroleum industries stood at Rs. 196 crores or 13 per cent, Service industries had Rs. 393 crores or 25 per cent of the total investments. Bulk of this money went into construction, utilities and transport and to specialized financial institutions.

**Foreign Collaborations:** Between 1957 and 1971, 3,374 foreign collaboration agreements were approved by the Government of India. The U.K. topped the list with 885, followed by the U.S.A. 608, West Germany 524, Japan 307, Switzerland 158, France 154 and others 738.

An industry-wise classification reveals that foreign collaboration approvals for industrial machinery (other than textile machinery) were the highest as 471. Then came electrical equipment, apparatus, components etc. 420, machine tools and accessories 244, transport equipments 227, basic chemicals 187, chemical products 195 and other industries 1,630.

**Policy on Collaboration:** Jawaharlal Nehru's statement in Parliament on April 6, 1949, remains the authentic exposition of Government's policy on participation of foreign capital in India's economic development. The State recognized the role of foreign capital in supplementing national savings and also in making available to the country the scientific, technical and industrial knowledge, as also the capital equipment which foreign capital brings with it. At the same time, the statement emphasized the need to regulate the scope and mode of foreign capital in the national interest with the object of utilizing it most advantageously.

The conditions under which foreign capital is welcome are:

1. All undertakings, whether Indian or foreign, have to conform to

TABLE LXXXVI

| <b>Total:</b> |                                                           | <b>81</b>              | <b>1,124</b> | <b>2,756</b> | <b>3,357</b>     | <b>7,008</b> |

the general requirements of the declared industrial policy.

2. Foreign enterprises would be treated on a par with Indian enterprises.

3. Foreign enterprises would be free to remit profits and repatriate capital subject to foreign exchange regulations.

4. In the event of nationalization of a foreign undertaking, fair and equitable compensation would be paid.

5. As a rule, the major interest, ownership and effective control of an undertaking should be in Indian hands.

In the last two decades, India's industrial base has been broadened and its manufacturing sector widely diversified. Also, there has been significant development of indigenous know-how and consequently, Government exercises a greater degree of selectivity. Foreign collaboration/investment is accepted only in fields of relatively high priority and in areas where sophisticated foreign technology would become available to the country. Foreign investment is welcome primarily in manufacturing industries in which Indian enterprise is not fully developed and the products of which could help increase India's foreign exchange resources either by increasing exports or by reducing current inputs.

Since 1968, a Foreign Investment Board has been functioning as a local agency within Government for expeditiously dealing with all matters relating to foreign private investments/collaboration.

Certain recent policy trends in respect of foreign investment and collaboration may be noticed:

(i) Equality: Generally, the policy is to allow minority participation, the usual preference being upto 40 per cent. In very exceptional cases, majority participation may be considered if a project requires sophisticated technology not available in India or involves substantial amount of foreign exchange, which is not available from alternative sources or is essentially export oriented.

(ii) Royalty: Payments, subject to tax, are allowed upto a maximum of 5 per cent. Royalty is calculated on the basis of the ex-factory selling price of the product less landed cost of import content, irrespective of the country of supply. Government does not normally allow any minimum guaranteed royalty. No royalty payments are allowed in case of collaboration between a wholly owned subsidiary in India and the parent company.

(iii) Duration: The duration of collaboration agreements is restricted to five years from the date of agreement or five years from the date of commencement of production. However, such a date should not exceed three years after the signing of the agreement, which means a maximum of eight years are allowed. Renewals are considered on the merit of each case.

(iv) Exports: Foreign investment and collaboration are welcomed

liberally in industries which are predominantly export-oriented and where the link with the collaborating party will provide an avenue for export.

In January 1969, policy decisions were taken aimed at increasing exports involving foreign collaboration. Units with substantial export performance to their credit would be allowed, on merits, to expand their production capacity to enable them to step up their exports.

**Tax Incentives:** The Indian tax laws offer a wide range of tax incentives and special incentives for foreign/non-resident tax payers.

Among incentives for savings and investment are a five-year tax holiday for new industrial enterprises, tax exemption for 'priority' industries, depreciation allowance development rebate, deduction of expenditure on scientific research, export markets development allowance, agricultural development allowance, concessional treatment of inter-corporate dividends, tax-free dividends, wealth tax exemption, tax credit certificates, and exemption of income from provision of technical know-how or services.

Special incentives for the foreign or non-resident tax payers are:

- (1) Concessional tax on royalties and technical service fees received by a foreign company.
- (2) Exemption from surtax or royalties, interest and technical service fees of foreign companies.
- (3) Tax exemption to foreign technicians employed in India.
- (4) Tax free interest on loans from specified foreign sources.
- (5) Deduction of expenses on education of children outside India.
- (6) Exemption of leave passage money.
- (7) Exemption for foreign employees for services rendered in India.
- (8) Exemption from tax on export income.
- (9) Exemption on remittances to India out of foreign profits or capital.

The growing number of collaborations owes a great deal to Government policy, both deliberate and undesigned. By means of import restrictions, the Government has raised profits on home production; and among the foreign firms that wish to share in the protected market, the Government has shown hostility towards those that are entirely owned abroad. So collaboration has become more or less a *sine qua non* for foreign firms wishing to enter the Indian market. Similar hostility towards foreign control reduces the attraction of financial investment in India, and correspondingly increases the advantage of the sale of know-how for royalties.

The object of the Government in encouraging collaboration is four-fold:

- (a) By their means we would be replacing the import of goods by the

import of capital and know-how, substituting domestic for foreign labour and materials and thereby saving exchange.

(b) The import of know-how would educate our countrymen in industrial techniques and take the country towards technological self-dependence.

(c) Finance brought into collaborations from abroad would be free from political strings unlike Government grants or loans.

(d) The outflow of returns on imported equity capital would be more flexible than on foreign loans and could be more easily adjusted to our payments circumstances.

Foreign technical help can be obtained in three forms: employment of foreign technical personnel, technical consultancy arrangement, and technical collaboration arrangement. The first two are essentially personal in nature, while the third is institutional. The growing phenomenon noticed since 1957 is the rise in this third form of technical assistance arrangement.

The advantages of a collaboration arrangement are that it enables the country to take a start on its development effort at a higher level of technology than if it were to seek to develop on its own. It thereby enables development not only to take place faster but also helps avoid waste of capital, both as a result of experimentation and of delays in obtaining output from equipment. The agreements have also helped many new *entrepreneurs* to take up industry. The large number of new *entrepreneurs* who have come up in recent years have been greatly helped by their collaboration with well-known foreign firms, often in technically difficult industries. An essential advantage, particularly where the foreign partner also participates in the capital and management of the Indian company, is the adherence to improved management practices and strict quality control that it ensures.

**Repetitive Collaboration:** On the subject of foreign collaboration, the Committee of Inquiry on Industrial Licensing Policy, has discussed at length what it calls "repetitive collaboration". This phenomenon it says, arises in the form of collaborations being entered into for a product irrespective of the fact that it is already being produced on the basis of another foreign collaboration agreement. As a result, agreements are entered into by a number of Indian firms either with the same foreign party or with a number of foreign parties for the same product.

Analysing the list of foreign collaborations, the Committee has found that 363 categories were involved in repetitive collaborations. Of these, there were 50 products for which collaborations in multiple numbers have been granted in the same year. Also there has been significant difference in the terms of approval in many cases. It gives the example of how in calculating the payment of royalty, several bases have been

*accepted in different agreements.*

The Committee has enumerated areas of production, mostly of consumer goods, where there is no great advantage in obtaining foreign know-how, much less granting repetitive collaboration. Some of the items are loudspeakers, toys, sports goods, spectacle hinges, ball point pens, tooth paste, readymade garments etc.

Similarly, multiple collaborations have been permitted and renewed in respect of items like domestic refrigerators, radio receivers, transistors, tape-recorders, gramophones, record changers and cameras. These non-essential goods the Committee concludes, lead to outflow of foreign exchange over long periods of time.

On the question of indigenous production of these items contributing to import substitution, the Committee says it is inconceivable that such goods would have been at all imported in view of the difficult foreign exchange situation. Further not all imports need to be substituted.

The Committee has also been critical of another type of collaboration-items in which production has already been well established and no further major import of technology is necessary.

## **APPENDIX I**

### **Government of India Resolution on Industrial Policy dated the 6th April, 1948**

The Government of India have given careful thought to the economic problems facing the country. The nation has now set itself to establish a social order where justice and equality of opportunity shall be secured to all the people. The immediate objective is to provide educational facilities and health services on a much wider scale, and to promote a rapid rise in the standard of living of the people by exploiting the latent resources of the country, increasing production and offering opportunities to all for employment in the service of the community. For this purpose, careful planning and integrated effort over the whole field of national activity are necessary; and the Government of India propose to establish a National Planning Commission to formulate programmes of development and to secure their execution. The present statement, however, confines itself to Government's policy in the industrial field.

Any improvement in the economic conditions of the country postulates an increase in national wealth; a mere redistribution of existing wealth would make no essential difference to the people and would merely mean the distribution of poverty. A dynamic national policy must, therefore, be directed to a continuous increase in production by all possible means, side by side with measures to secure its equitable distribution. In the present state of the nation's economy, when the mass of the people are below the subsistence level, the emphasis should be on the expansion of production, both agricultural and industrial; and in particular on the production of capital equipment, of goods satisfying the basic needs of the people, and of commodities the export of which will increase earnings of foreign exchange.

The problem of State participation in Industry and the conditions in which private enterprise should be allowed to operate must be judged in this context. There can be no doubt that the State must play a progressively active role in the development of industries, but ability to achieve the main objectives should determine the immediate extent of State responsibility and the limits to private enterprise. Under present conditions, the mechanism and the resources of the State may not permit it to function forthwith in Industry as widely as may be desirable. The Government of India are taking steps to remedy the situation; in particular, they are considering steps to create a body of men trained in business methods and management. They feel, however, that for some time to come, the State could contribute more quickly to the increase of

national wealth by expanding its present activities wherever it is already operating and by concentrating on new units of production in other fields, rather than on acquiring and running existing units. Meanwhile, private enterprise, properly directed and regulated, has a valuable role to play.

On these considerations, the Government have decided that the manufacture of arms and ammunition, the production and control of atomic energy, and the ownership and management of railway transport should be the exclusive monopoly of the Central Government. Further, in any emergency, the Government would always have the power to take over any industry vital for national defence. In the case of the following industries, the State — which in this context, includes Central, Provincial and State Governments and other Public Authorities like Municipal Corporations — will be exclusively responsible for the establishment of new undertakings, except where, in the national interest, the State itself finds it necessary to secure the co-operation of private enterprise subject to such control and regulation as the Central Government may prescribe:—

- (1) Coal (the Indian Coalfields Committee's proposals will be generally followed).
- (2) Iron and Steel.
- (3) Aircraft Manufacture.
- (4) Shipbuilding.
- (5) Manufacture of telephone, telegraph and wireless apparatus, excluding radio receiving sets.
- (6) Mineral Oils.

While the inherent right of the State to require any existing industrial undertaking will always remain, and will be exercised whenever the public interest requires it, Government have decided to let existing undertakings in these fields develop for a period of ten years, during which they will be allowed all facilities for efficient working and reasonable expansion. At the end of this period, the whole matter will be reviewed and a decision taken in the light of circumstances obtaining at the time. If it is decided that the State should acquire any unit, the fundamental rights guaranteed by the Constitution will be observed and compensation will be awarded on a fair and equitable basis.

Management of State enterprise will, as a rule, be through the medium of public corporations under the statutory control of the Central Government, who will assume such powers as may be necessary to ensure this.

The Government of India have recently promulgated a measure for the control by the State of the generation and distribution of electric power. This industry will continue to be regulated in terms of this measure.

The rest of the industrial field will normally be open to private enterprise, individual as well as co-operative. The State will also progressively

participate in this field; nor will it hesitate to intervene whenever the progress of an industry under private enterprise is unsatisfactory. The Central Government have already embarked on enterprises like large river-valley developments, which are multi-purpose projects of great magnitude, involving extensive generation of hydro-electric power and irrigation on a vast scale, and are calculated in a comparatively short time to change the entire face of large areas in this country. Projects like the Damodar Valley Scheme, the Kosi Reservoir, the Hirakud Dam, etc., are in a class by themselves and can stand comparison with any of the major schemes in America or elsewhere. The Central Government have also undertaken the production of fertilizer on a very large scale and have in view other enterprises like the manufacture of essential drugs, and of synthetic oil from coal; many Provincial and State Governments are also proceeding on similar lines.

There are certain basic industries of importance, apart from those mentioned in paragraph 4, the planning and regulation of which by the Central Government is necessary in the national interest. The following industries whose location must be governed by economic factors of all-India import, or which require considerable investment or a high degree of technical skill, will be the subject of a Central regulation and control:

- (1) Salt.
- (2) Automobiles and tractors.
- (3) Prime Movers.
- (4) Electric Engineering.
- (5) Other heavy machinery.
- (6) Machine tools.
- (7) Heavy chemicals, fertilizers and pharmaceuticals and drugs.
- (8) Electro-chemical industries.
- (9) Non-ferrous metals.
- (10) Rubber Manufactures.
- (11) Power and industrial alcohol.
- (12) Cotton and woollen textiles.
- (13) Cement.
- (14) Sugar.
- (15) Paper and newsprint.
- (16) Air and Sea Transport.
- (17) Minerals.
- (18) Industries related to defence.

The above list cannot obviously be of an exhaustive nature. The Government of India, while retaining the ultimate direction over this field of industry, will consult the Governments of the Provinces and States at all stages and fully associate them in the formulation and execution of plans. Besides these Governments, representatives of

Industry and Labour will also be associated with the Central Government in the Industrial Advisory Council and other bodies which they propose to establish, as recommended by the Industries Conference.

Cottage and small-scale industries have a very important role in the national economy, offering as they do scope for individual, village or co-operative enterprise, and means for the rehabilitation of displaced persons. These industries are particularly suited for the better utilisation of local resources and for the achievement of local self-sufficiency in respect of certain types of essential consumer goods like food, cloth and agricultural implements. The healthy expansion of cottage and small-scale industries depends upon a number of factors like the provision of raw materials, cheap power, technical advice, organised marketing of their produce, and, where necessary, safeguards against intensive competition by large-scale manufacture, as well as on the education of the worker in the use of the best available technique. Most of these fall in the Provincial sphere and are receiving the attention of the Governments of the Provinces and the States. The Resolution of the Industries Conference has requested the Central Government to investigate how far and in what manner these industries can be co-ordinated and integrated with large scale industries. The Government of India accept this recommendation. It will be examined, for example, how the textile mill industry can be made complementary to, rather than competitive with the handloom industry, which is the country's largest and best organised cottage industry. In certain other lines of production, like agricultural implements, textile accessories, and parts of machine tools, it should be possible to produce components on a cottage industry scale and assemble these into their final product at a factory. It will also be investigated how far industries at present highly centralised could be decentralised with advantage.

The Resolution of the Industries Conference has recommended that Government should establish a Cottage Industries Board for the fostering of small scale industries. The Government of India accept this recommendation and propose to create suitable machinery to implement it. A Cottage and Small-scale Industries Directorate will also be set up within the Directorate General of Industries and Supplies.

One of the main objectives will be to give a distinctly co-operative bias to this field of industry. During and before the last war, even a predominantly agricultural country like China showed what could be done in this respect, and her mobile industrial co-operative units were of outstanding assistance in her struggle against Japan. The present international situation is likely to lessen to a marked degree our chances of getting capital goods for large-scale industry, and the leeway must be made up by having recourse to small-size industrial co-operatives throughout the country.

The Government, however, recognise that their objective, viz., securing the maximum increase in production, will not be realised merely by prescribing the respective spheres of the State and of private enterprise in Industry; it is equally essential to ensure the fullest co-operation between labour and management and the maintenance of stable and friendly relations between them. A Resolution on this subject was unanimously passed by the Industries Conference which was held in December last. Amongst other things, the Resolution states:—

“....The system of remuneration to capital as well as labour must be so devised that, while in the interests of the consumers and the primary producers, excessive profits should be prevented by suitable methods of taxation and otherwise, both will share the product of their common effort, after making provision for payment of fair wages to labour, a fair return on capital employed in the industry and reasonable reserves for the maintenance and expansion of the undertaking.”

Government accept this Resolution. They also consider that labour's share of the profits should be on a sliding scale normally varying with production. They propose, in addition to the over-all regulation of industry by the State, to establish machinery for advising on fair wages, fair remuneration for capital, and conditions of labour. They will also take steps to associate labour in all matters concerning industrial production.

The machinery which Government propose to set up will function at different levels, central, regional and unit. At the Centre, there will be a Central Advisory Council, which will cover the entire field of industry, and will have under it Committees for each major industry. These Committees may be split up into sub-committees dealing with specific questions relating to the industry, e.g., production, industrial relations, wage fixation, and distribution of profits. The regional machinery under the Provincial Governments will be Provincial Advisory Boards which, like the Central Advisory Council, will cover the entire field of industry within the province; they will have under them the Provincial Committees for each major industry. The Provincial Committees may also be split up into various sub-committees dealing with specific questions relating to production, wage fixation and industrial relations. Below the Provincial Committees will come the Works Committees and the Production Committees attached to each major industrial establishment.

The Works Committees and the Production Committees will be bipartite in character, consisting of representatives of employers and workers only, in equal numbers. All other Committees will be tripartite, with representatives of Government, employers and workers.

Government hope that the machinery proposed will substantially reduce the volume of industrial disputes. In the case of unresolved

conflicts, Government trust that management and labour will, in their own interests and in the larger interests of the country, agree to settle them through recognised channels of conciliation and arbitration, which will be provided by Government. The Industrial Relations Machinery, both at the Centre and in the Provinces, is being strengthened, and permanent Industrial Tribunals are being established for dealing with major disputes.

The Government of India are also taking special steps to improve industrial housing as quickly as possible. A scheme for the construction of one million workers' houses in ten years is under contemplation, and a Housing Board is being constituted for this purpose. The cost will be shared in suitable proportions between Government, employers and labour, the share of labour being recovered in the form of a reasonable rent.

In order to ensure quick decisions on the various matters arising out of the Industrial Truce Resolution, Government are appointing a special officer.

The Government of India agree with the view of the Industries Conference that, while it should be recognised that participation of foreign capital and enterprise, particularly as regards industrial technique and knowledge, will be of value to the rapid industrialisation of the country, it is necessary that the conditions under which they may participate in Indian industry should be carefully regulated in the national interest. Suitable legislation will be introduced for this purpose. Such legislation will provide for the scrutiny and approval by the Central Government of every individual case of participation of foreign capital and management in industry. It will provide that, as a rule, the major interest in ownership, and effective control, should always be in the Indian hands; but power will be taken to deal with exceptional cases in a manner calculated to serve the national interest. In all cases, however, the training of suitable Indian personnel for the purpose of eventually replacing foreign experts will be insisted upon.

The Government of India are fully alive to their direct responsibility for the development of those industries which they have found necessary to reserve exclusively for State enterprise. They are equally ready to extend their assistance to private or co-operative enterprise in the rest of the industrial field, and in particular, by removing transport difficulties and by facilitating the import of essential raw materials to the maximum possible extent. The tariff policy of Government will be designed to prevent unfair foreign competition and to promote the utilisation of India's resources without imposing unjustifiable burdens on the consumer. The system of taxation will be reviewed and readjusted where necessary to encourage saving and productive investment and to prevent undue concentration of wealth in a small section of the

population.

The Government of India hope that this elucidation of their intentions of fundamental aspects of industrial policy will remove all misapprehensions, and they are confident that a joint and intensive effort will now be made by labour, capital and the general public, which will pave the way for the rapid industrialisation of the country.

*in the Rapid industrialisation of the  
Country.*

## APPENDIX II

### **Statement Made by the Prime Minister in the Constituent Assembly of India (Legislative) On 6 April, 1949.**

The policy as regards participation of foreign capital has already been announced in broad terms in Government's resolution of the 6th April, 1948. The stress on the need to regulate, in the national interest the scope and manner for foreign capital arose from past association of foreign capital and control with foreign domination of the economy of the country. But circumstances today are quite different. The object of our regulation should therefore be the utilisation of foreign capital in a manner most advantageous to the country. Indian capital needs to be supplemented by foreign capital not only because our national savings will not be enough for the rapid development of the country on the scale we wish, but also because in many cases scientific, technical and industrial knowledge and capital equipment can best be secured along with foreign capital.

In this context, foreign investors would no doubt wish to have some clear indication of our policy on certain matters, like the repatriation of capital, their remittance of profits, and the treatment of foreign enterprise *vis-a-vis* Indian enterprise. I propose to make the policy of Government quite clear in this matter.

In the first place, I would like to state that Government would expect all undertakings, Indian or foreign, to conform to the general requirements of their industrial policy. As regards existing foreign interests, Government do not intend to place any restrictions or impose any conditions which are not applicable to similar Indian enterprise. Government would also so frame their policy as to enable further foreign capital to be invested in India on terms and conditions that are mutually advantageous.

Secondly, foreign interests would be permitted to earn profits, subject only to regulations common to all. We do not foresee any difficulty in continuing the existing facilities for remittance of profits, and Government have no intention to place any restriction on withdrawal of foreign capital investments, but remittance facilities would naturally depend on foreign exchange considerations. If, however, any foreign concerns come to be compulsorily acquired, Government would provide reasonable facilities for the remittance of proceeds.

Thirdly, if and when foreign enterprises are compulsorily acquired, compensation will be paid on a fair and equitable basis as already announced in Government's statement of policy.

Government have stated before that, as a rule, the major interest in ownership and effective control of an undertaking should be in Indian hands. They have also stated that power will be taken to deal with exceptional cases in a manner calculated to serve the national interest. Obviously there can be no hard and fast rule in this matter. Government will not object to foreign capital having control of a concern for a limited period, if it is found to be in the national interest and each individual case will be dealt with on its merits. In the matter of employment of personnel, Government would not object to the employment of non-Indian in posts requiring technical skill and experience, when Indians of requisite qualifications are not available, but they attach vital importance to the training and employment of Indians even for such posts in the quickest possible manner.

I should like to add a few words about British interests in India which naturally form the largest part of foreign investments in India. Although it is the policy of the Government of India to encourage the growth of Indian industry and commerce (including such services like Banking, Shipping and Insurance) to the best of their ability, there is and will still be considerable scope for the investment of British capital in India. These considerations will apply equally to other existing non-Indian interests. The Government of India have no desire to injure in any way British or other non-Indian interests in India and would gladly welcome their contribution in a constructive and co-operative role in the development of India's economy.

### APPENDIX III

**Government of India  
Industrial Policy Resolution  
New Delhi, the 30th April, 1956**

The Government of India set out in their Resolution dated the 6th April, 1948, the policy which they proposed to pursue in the industrial field. The Resolution emphasised the importance to the economy of securing a continuous increase in production and its equitable distribution, and pointed out that the State must play a progressively active role in the development of industries. It laid down that besides arms and ammunition, atomic energy and railway transport, which would be the monopoly of the Central Government the State would be exclusively responsible for the establishment of new undertakings in six basic industries — except where, in the national interest, the State itself found it necessary to secure the co-operation of private enterprise. The rest of the industrial field was left open to private enterprise though it was made clear that the State would also progressively participate in this field.

2. Eight years have passed since this declaration on industrial policy. These eight years have witnessed many important changes and developments in India. The Constitution of India has been enacted, guaranteeing certain Fundamental Rights and enunciating Directive Principles of State Policy. Planning has proceeded on an organised basis, and the first Five Year Plan has recently been completed. Parliament has accepted the socialist pattern of society as the objective of social and economic policy. These important developments necessitate a fresh statement of industrial policy, more particularly as the second Five Year Plan will soon be placed before the country. This policy must be governed by the principles laid down in the Constitution, the objective of socialism, and the experience gained during these years.

3. The Constitution of India, in its preamble, has declared that it aims at securing for all its citizens —

“JUSTICE, Social, economic and political:

LIBERTY of thought, expression, belief, faith and worship;

EQUALITY of status and of opportunity; and to promote among them all;

FRATERNITY assuring the dignity of the nation.”

In its Directive Principles of State Policy, it is stated that:—

“The State shall strive to promote the welfare of the people by securing and protecting as effectively as it may a social order in which justice,

social, economic and political, shall inform all the institutions of the national life."

Further that —

"The State shall, in particular, direct its policy towards securing —

- (a) that the citizens, men and women equally, have the right to an adequate means of livelihood;
- (b) that the ownership and control of the material resources of the community are so distributed as best to subserve the common good;
- (c) that the operation of the economic system does not result in the concentration of wealth and means of production to the common detriment;
- (d) that there is equal pay for equal work for both men and women;
- (e) that the health and strength of workers, men and women, and the tender age of children are not abused and that citizens are not forced by economic necessity to enter avocations unsuited to their age or strength;
- (f) that childhood and youth are protected against exploitation and against moral and material abandonment."

4. These basic and general principles were given a more precise direction when Parliament accepted in December, 1954, the socialist pattern of society as the objective of social and economic policy. Industrial policy, as other policies, must therefore be governed by these principles and directions.

5. In order to realise this objective, it is essential to accelerate the rate of economic growth and to speed up industrialisation and, in particular, to develop heavy industries and machine making industries, to expand the public sector, and to build up a large and growing co-operative sector. These provide the economic foundations for increasing opportunities for gainful employment and improving living standards and working conditions for the mass of the people. Equally, it is urgent, to reduce disparities in income and wealth which exist today, to prevent private monopolies and the concentration of economic power in different fields in the hands of small numbers of individuals. Accordingly, the State will progressively assume a predominant and direct responsibility for setting up new industrial undertakings and for developing transport facilities. It will also undertake State trading on an increasing scale. At the same time, as an agency for planned national development, in the context of the country's expanding economy, the private sector will have the opportunity to develop and expand. The principle of co-operation should be applied wherever possible and a steadily increasing proportion of the activities of the private sector developed along co-operative lines.

6. The adoption of the socialist pattern of society as the national objective, as well as the need for planned and rapid development, require that all industries of basic and strategic importance, or in the nature of public utility services, should be in the public sector. Other industries which are essential and require investment on a scale which only the State, in present circumstances, could provide, have also to be in the public sector. The State has therefore to assume direct responsibility for the future development of industries over a wider area. Nevertheless, there are limiting factors which make it necessary at this stage for the State to define the field in which it will undertake sole responsibility for further development, and to make a selection of industries in the development of which it will play a dominant role. After considering all aspects of the problem, in consultation with the Planning Commission, the Government of India have decided to classify industries into three categories, having regard to the part which the State would play in each of them. These categories will inevitably overlap to some extent and too great a rigidity might defeat the purpose in view. But the basic principles and objectives have always to be kept in view and the general directions hereafter referred to be followed. It should also be remembered that it is always open to the State to undertake any type of industrial production.

7. In the first category will be industries the future development of which will be the exclusive responsibility of the State. The second category will consist of industries, which will be progressively State-owned and in which the State will therefore generally take the initiative in establishing new undertakings, but in which private enterprise will also be expected to supplement the effort of the State. The third category will include all the remaining industries, and their future development will, in general, be left to the initiative and enterprise of the private sector.

8. Industries in the first category have been listed in Schedule A of this Resolution. All new units in these industries, save where their establishment in the private sector has already been approved, will be set up only by the State. This does not preclude the expansion of the existing privately owned units, or the possibility of the State securing the co-operation of private enterprise in the establishment of new units when the national interests so require. Railways and air transport, arms and ammunition and atomic energy will, however, be developed as Central Government monopolies. Whenever co-operation with private enterprise is necessary, the State will ensure, either through majority participation in the capital or otherwise, that it has the requisite powers to guide the policy and control the operations of the undertakings.

9. Industries in the second category will be those listed in Schedule B. With a view to accelerating their future development, the State will

increasingly establish new undertakings in these industries. At the same time private enterprise will also have the opportunity to develop in this field, either on its own or with State participation.

10. All the remaining industries will fall in the third category, and it is expected that their development will be undertaken ordinarily through the initiative and enterprise of the private sector, though it will be open to the State to start any industry even in this category. It will be the policy of the State to facilitate and encourage the development of these industries in the private sector, in accordance with the programmes formulated in successive Five Year Plans, by ensuring the development of transport, power and other services, and by appropriate fiscal and other measures. The State will continue to foster institutions to provide financial aid to these industries and special assistance will be given to enterprises organised on co-operative lines for industrial and agricultural purposes. In suitable cases, the State may also grant financial assistance to the private sector. Such assistance, especially when the amount involved is substantial, will preferably be in the form of participation in equity capital, though it may also be in part in the form of debenture capital.

11. Industrial undertakings in the private sector have necessarily to fit into the framework of the social and economic policy of the State and will be subject to control and regulation in terms of the Industries (Development and Regulation) Act and other relevant legislation. The Government of India, however, recognise that it would, in general, be desirable to allow such undertakings to develop with as much freedom as possible, consistent with the targets and objectives of the national plan. When there exist in the same industry both privately and publicly owned units, it would continue to be the policy of the State to give fair and non-discriminatory treatment to both of them.

12. The division of industries into separate categories does not imply that they are being placed in water-tight compartments. Inevitably, there will not only be an area of overlapping but also a great deal of dovetailing between industries in the private and the public sectors. It will be open to the State to start any industry not included in Schedule A and Schedule B when the needs of planning so require or there are other important reasons for it. In appropriate cases, privately owned units may be permitted to produce an item falling within Schedule A for meeting their own requirements or as by-products. There will be ordinarily no bar to small privately owned units undertaking production, such as the making of launches and other light-craft, generation of power for local needs and small scale mining. Further, heavy industries in the public sector may obtain some of their requirements of lighter components from the private sector, while the private sector in turn would rely for many of its needs on the public sector. The same

principle would apply with even greater force to the relationship between large scale and small scale industries.

13. The Government of India would, in this context, stress the role of cottage and village and small scale industries in the development of the national economy. In relation to some of the problems that need urgent solutions, they offer some distinct advantages. They provide immediate large scale employment; they offer a method of ensuring a more equitable distribution of the national income and they facilitate an effective mobilisation of resources of capital and skill which might otherwise remain unutilised. Some of the problems that unplanned urbanisation tends to create will be avoided by the establishment of small centres of industrial production all over the country.

14. The State has been following a policy of supporting cottage and village and small scale industries by restricting the volume of production in the large scale sector, by differential taxation, or by direct subsidies. While such measures will continue to be taken, whenever necessary, the aim of the State policy will be to ensure that the decentralised sector acquires sufficient vitality to be self-supporting and its development is integrated with that of large scale industry. The State will, therefore, concentrate on measures designed to improve the competitive strength of the small scale producer. For this it is essential that the technique of production should be constantly improved and modernised, the pace of transformation being regulated so as to avoid, as far as possible, technological unemployment. Lack of technical and financial assistance, of suitable working accommodation and inadequacy of facilities for repair and maintenance are among the serious handicaps of small scale producers. A start has been made with the establishment of industrial estates and rural community workshops to make good these deficiencies. The extension of rural electrification and the availability of power at prices which the workers can afford will also be of considerable help. Many of the activities relating to small scale production will be greatly helped by the organisation of industrial co-operatives. Such co-operatives should be encouraged in every way and the State should give constant attention to the development of cottage and village and small scale industry.

15. In order that industrialisation may benefit the economy of the country as a whole, it is important that disparities in levels of development between different regions should be progressively reduced. The lack of industries in different parts of the country is very often determined by factors such as the availability of the necessary raw materials or other natural resources. A concentration of industries in certain areas has also been due to the ready availability of power, water supply and transport facilities which have been developed there. It is one of the aims of national planning to ensure that these facilities are steadily

made available to areas which are at present lagging behind industrially or where there is greater need for providing opportunities for employment, provided the location is otherwise suitable. Only by securing a balanced and co-ordinated development of the industrial and the agricultural economy in each region, can the entire country attain higher standards of living.

16. This programme of industrial development will make large demands on the country's resources of technical and managerial personnel. To meet these rapidly growing needs for the expansion of the public sector and for the development of village and small scale industries, proper managerial and technical cadres in the public services are being established. Steps are also being taken to meet shortages at supervisory levels, to organise apprenticeship schemes of training on a large scale both in public and in private enterprises, and to extend training facilities in business management in universities and other institutions.

17. It is necessary that proper amenities and incentives should be provided for all those engaged in industry. The living and working conditions of workers should be improved and their standard of efficiency raised. The maintenance of industrial peace is one of the prime requisites of industrial progress. In a socialist democracy labour is a partner in the common task of development and should participate in it with enthusiasm. Some laws governing industrial relations have been enacted and a broad common approach has developed with the growing recognition of the obligation of both management and labour. There should be joint consultation and workers and technicians should, wherever possible, be associated progressively in management. Enterprises in the public sector have to set an example in this respect.

18. With the growing participation of the State in industry and trade, the manner in which these activities should be conducted and managed assumes considerable importance. Speedy decisions and a willingness to assume responsibility are essential if these enterprises are to succeed. For this, wherever possible, there should be decentralisation of authority and their management should be along business lines. It is to be expected that public enterprises will augment the revenues of the State and provide resources for further development in fresh fields. But such enterprises may sometimes incur losses. Public enterprises have to be judged by their total results and in their working they should have the largest possible measure of freedom.

19. The Industrial Policy Resolution of 1948 dealt with a number of other subjects which have since been covered by suitable legislation or by authoritative statements of policy. The division of responsibility between the Central Government and the State Governments in regard to industries has been set out in the Industries (Development and Regulation) Act. The Prime Minister, in his statement in Parliament

on the 6th April, 1949, has enunciated the policy of the State in regard to foreign capital. It is, therefore, not necessary to deal with these subjects in this resolution.

20. The Government of India trust that this restatement of their Industrial Policy will receive the support of all sections of the people and promote the rapid industrialisation of the country.

#### SCHEDULE A

1. Arms and ammunition and allied items of defence equipment.
2. Atomic energy.
3. Iron and steel.
4. Heavy castings and forgings of iron and steel.
5. Heavy plant and machinery required for iron and steel production, for mining, for machine tool manufacture and for such other basic industries as may be specified by the Central Government.
6. Heavy electrical plant including large hydraulic and steam turbines.
7. Coal and lignite.
8. Mineral oils.
9. Mining of iron ore, manganese ore, chrome ore, gypsum, sulphur, gold and diamond.
10. Mining and processing of copper, lead, zinc, tin, molybdenum and wolfram.
11. Minerals specified in the Schedule to the Atomic Energy (Control of Production and Use) Order, 1953.
12. Aircraft.
13. Air transport.
14. Railway transport.
15. Shipbuilding.
16. Telephones and telephone cables, telegraph and wireless apparatus (excluding radio receiving sets).
17. Generation and distribution of electricity.

#### SCHEDULE B

1. All other minerals except "minor minerals" as defined in Section 3 of the Minerals Concession Rules, 1949.
2. Aluminium and other non-ferrous metals not included in Schedule 'A'.
3. Machine tools.
4. Ferro-alloys and tool steels.
5. Basic and intermediate products required by chemical industries such as the manufacture of drugs, dyestuffs and plastics.

6. Antibiotics and other essential drugs.
7. Fertilizers.
8. Synthetic rubber.
9. Carbonisation of coal.
10. Chemical pulp.
11. Road transport.
12. Sea transport.

## APPENDIX IV

## CHAPTER IX

# TRANSPORT AND COMMUNICATIONS

### I. State of Transport Prior to Railway Age

Information is rather scanty about the state of communications and transport in India prior to the Mauryan Era. A clearer picture of the conditions is available on coming down to the Mauryan times when political consolidation and more efficient administration promoted commerce and industry and greater use of communications and transport for internal and foreign trade. A Royal Road, 10,000 *stades* (about 2,400 km.) in length, ran from the North-West Frontier to Pataliputra, with milestones showing distances and by-roads and signposts at every tenth *stade*. Kautilya refers to the maintenance of the King's Highway (*Rajamarga*) at public expense and of State roads and paths for asses, camels, cart-tracks, foot-paths and others. The principal highway from Rajagriha through Sravasti connected Taxila and the frontiers and Central and Western Asia. Apart from these arterial routes, there was a network of other roads providing means for internal communication. The greater economic importance of the southern routes from the point of view of trade connections was stressed by Kautilya. Frequent travel by officials of a centralized and bureaucratic administration contributed to the maintenance of good communications. Land routes over which foreign trade was conducted also acquired a special importance and were naturally more frequently used.

There are many references to early maritime activity and foreign trade. The great activity during the reign of Asoka on colonial enterprises and cultural missions presumes the existence of an adequate sea-going fleet and of facilities for sea voyages. Kautilya refers to ships, both large and small, used for navigation and to the maintenance by the State of boats for hire and to the steps taken to destroy pirate ships. Ships sailed from Tamluk to various ports along the east coast. On the west coast, the sea route took ships to ports along the south-eastern coast of Arabia, in proximity to modern Aden, where Indian traders exchanged their goods for those from the Eastern Mediterranean region sent down the Red Sea.

The picture of internal and external trade and transport becomes fuller by about the early centuries of the Christian Era. The sea-ports and their importance in relation to foreign trade find frequent mention. The port of Berenice, built by Ptolemy Philadelphus (285-246 B.C.) on the Egyptian coast of the Red Sea, became the most important centre for Indian trade.

A brisk foreign trade between India and the West, particularly the Roman Empire, stimulated considerable amount of business activity in a number of ports on the west coast of India, namely, Barygaza (Brigukaccha, Bharugachha or Broach), Sopara, Kalyana, Naura, Tyndis, Muziris (Musiripattanam or Cranganore) and Neleynda (Nilakantha). After Hippalus discovered the favourable monsoon winds, the Greek and Egyptian traders could make direct voyages from the Gulf of Aden to the Malabar Coast. The discovery of Roman coins over a wide area in South India attests to the spread of Roman trade with India.

The Tamils had taken to the sea quite early and found their way to South East Asia in the first century A.D. Foreign trade extended by the third decade of the sixth century A.D. to China through Indonesia on the east and to Ethiopia and the Homerite country (Arabia) on the west.

Glimpses of the conditions of trade and transport afforded in the accounts of travellers, such as Hiuen Tsang (A.D. 629-645) and Marco Polo (A.D. 1260), point to the attention given to roads and *rest houses*. About 1,700 *serais* were altogether built by Sher Shah with separate lodgings for Muslims and Hindus and with adequate supplies for the needs of travellers and their horses. Jean Baptiste Tavernier's travels in India during 1640-67, in a carriage drawn by bullocks from Kandahar-Multan to Dacca, Surat to Golconda, and thence to Masulipatam, were found by him to be as comfortable as in Europe. During the rains, transport was at a standstill, while during the hot weather when fodder and water were difficult to get, it was kept down to small limits.

The struggle among foreign powers to obtain control over the foreign trade with India shed an interesting sidelight on the significance of communications. The Portuguese opened the route *via* the Cape of Good Hope after Vasco da Gama landed in Calicut and later found ports or open roadsteads along the Malabar Coast where merchants from Sri Lanka or Malacca met those from the Persian Gulf or the Red Sea. Later the Dutch broke the Portuguese monopoly and were in turn ousted by the English.

With the arrival of these foreign powers, there is more information relating to the trade and economic conditions in India. Duarte Barbosa refers to the trade with Calicut and ship-building and ship-repairing activities at Cochin and Dharmapuram. The European merchants could only exploit the trade in the products of the coast and to articles of high value in comparatively small bulk. It was practically impossible to penetrate inland and to draw thence to the west coast the products of the interior. On the east coast there was no port on the surf-beaten line of shore until the Gangetic delta was reached at the head of the Bay of Bengal.

During the first half of the 19th century, roads were non-existent

except where they had been constructed for military purposes. With traffic generally having to be carried over narrow, unmetalled tracks, rendered impassable during the monsoon, the speed of movement was regulated by the capacity of the bullock carts struggling over the paths. Ten miles a day was a fair average. In many parts of the country where carts were unusable, pack-bullocks provided the only means of transport. Under these circumstances, a navigable river was a better means of transportation and trade could be carried on in boats. But, in the politically unsettled state of the country, roads and rivers alike were infested by bands of robbers and these conditions discouraged trade as well as travel.

The economic isolation of even neighbouring districts rendered the famine in one of them impossible to be alleviated by abundant harvests in another. Harvests in some parts of the country at times proved so plentiful that it would not pay to carry grain to markets. The ports were also ill-equipped for the reception and shipment of merchandise. The freight charges round the Cape of Good Hope from Calcutta, Madras and Bombay to London were so high and the duration of the voyage so long that, taking into consideration the charges for internal transit, trade was non-existent except in articles of special demand in which the country had more or less a monopoly and which could stand a long voyage.

It will not be incorrect to state that the conditions of internal trade and communications were mostly the same for centuries past till about the commencement of the railway age. Transporting foreign merchandise to the people at large and persuading the agriculturist to produce goods for overseas markets alike had to wait till the railway system was well advanced by about the decade 1860-70. Even then the Cape route kept the freights high and hampered trade, while the long voyage exposed the cargo of wheat and seeds to the damage caused by weevils. These difficulties were removed by the opening of the Suez Canal and the consequent reduction of the duration of the voyage from about a hundred days or more to about twenty-five days, or even three weeks with faster vessels. This change was of basic importance to Indian trade and it came about at a time when all the ports were connected to the interior by rail. The English merchant houses were now able to supply European manufactures at a cost within the means of the Indian consumer and, at the same time, export Indian products to Europe in good condition and at competitive prices, even as against countries more favourably situated, because of cheap labour of which India had an abundant supply. The result became manifest during the following decade, 1870-80, in a most striking development of trade.

Administrative needs and defence requirements for a power which was rapidly beginning to assume political control of the entire country

called for better communications. The changes connected with these developments are dealt with in the following sections. Although the advent of the railways has been only recent, the economic revolution they brought about in India, as in other countries, entitles them to be considered first. The other forms of transport, viz., road, inland water, coast-wise and ocean shipping and airways are taken up in the same order.

## II. Railways

The success which attended the early development of railways in Great Britain showed clearly the many advantages to be derived from the new form of transport in a country of considerable distances, politically still unconsolidated and requiring large scale movement of troops and military stores. It was not until 1845 that applications received by the Court of Directors from private parties for co-operation in opening railways on an extensive scale in different parts of India were sent to the Governor General for report. The Court preferred a cautious approach and a limited scale for the first attempts. Later the Court of Directors, realizing that, without a cheap means of communication, there could be no rapid progress in the country materially or in the efficiency of administration, desired that India should, without unnecessary loss of time, possess the immense advantage of a regular system of railway communication. Reviewing the question in an exhaustive minute in 1853, Lord Dalhousie urged the importance of a speedy and wide introduction of railway communications throughout India. He specially recommended that, in the first instance, a system of trunk lines should be formed, connecting the interior of each Presidency with each other.

The Court of Directors accepted the general plan proposed and, by the end of 1859, the following eight companies were formed for the construction of nearly 8,000 km. of line, with a capital under guarantee of £52,500,000 sterling, namely:

- (1) the East Indian Railway;
- (2) the Great Indian Peninsula Railway;
- (3) the Madras Railway;
- (4) the Bombay, Baroda and Central India Railway;
- (5) the Eastern Bengal Railway;
- (6) the Indian Branch (later the Oudh and Rohilkand) Railway;
- (7) the Sind, Punjab and Delhi (later merged in the North-Western) Railway;
- (8) the Great Southern of India (later the South Indian) Railway.

Thus was laid the foundation of the system of railways which, radiating from the ports of Calcutta, Bombay and Madras, literally extended throughout the length and breadth of India.

As companies could not be promoted without a minimum return on their capital guaranteed by the Government, a guarantee of 5 per cent was eventually agreed to, coupled with the free grant of all land needed; and the companies, in return, were required to share surplus profits half-yearly with the Government after the guaranteed interest for the half-year had been met, exchange for remittance of interest charges being reckoned at 22 *d* to the rupee, and permit the Government to exercise the closest control over all expenditure and over the management and working of the lines.

Unfortunately, all expectations in regard to profits came to naught because of the heavy outlay on construction built to a standard far in excess of the needs of the time. A committee of the House of Commons in 1857-58, enquiring into the delays, found that, apart from the standard of construction, far higher than required for the conditions of the country or for the actual work the railways were designed to perform, there were such other factors as the conveniences which, though desirable, were unnecessary for the safe or efficient operation of the railways; experimental lines built on double track, the necessity for which did not arise till a generation later; alteration in the routes after work had been actually commenced; and the outbreak of the Great Revolt of 1857 causing the suspension of all works for a time. Consequently, the earnings which might have been sufficient to pay interest charges on a reasonable expenditure proved inadequate to meet the guarantee on the outlay actually incurred. The Government had to make good the deficit.

When the railways failed to earn the guaranteed interest, the deficit to be met by Government became a recurring feature. In view of the increasing demands for guaranteed interest, the whole guarantee system fell into disrepute. Private enterprise still held aloof without a guarantee. The extension of railway communication was not keeping pace with the increasing requirements of the country, and the progress during the preceding ten years hardly averaged 560 km. of new line each year. The guaranteed railways had cost a great deal more than necessary in the absence of any incentive to keep down expenditure; and the Government believed that railways could be more cheaply constructed and more economically worked by direct agency of the State, while money could be borrowed at a lower rate than was paid under the guarantee. In 1869, the Government obtained sanction for the discontinuance of the guarantee system and for the construction of railways by the State.

The guaranteed companies had constructed on a gauge of 5' 6", costing about £10,560 a kilometre; a narrower gauge on 3' 3-3/8" metre gauge might be cheaper. The State Railways accordingly decided to build on the metre gauge. Even then progress was still not rapid enough and in 1875 the amount to be spent annually was raised to Rs. 4 crores. But war and famine reduced the funds available and a great

part of the expenditure was devoted to the conversion, for strategic reasons, of the recently begun lines on the North-West. The continued fall in the gold value of silver had also, by 1879, seriously disturbed the financial position of the Government. Resort had, therefore, again to be made to the companies to construct railways under a guarantee. The system now adopted was distinguished from the old guarantee in that the terms were easier for the Government. The lines thus promoted were: the Indian Midland (1882-85), later merged in the Great Indian Peninsula; the Bengal Nagpur (1883-87); the Southern Mahratta (1882); and the Assam Bengal Railways (1891). The total length of these lines exceeded 6,400 km.

The results of the Government's efforts to attract unaided private enterprise were not encouraging. Of the four companies promoted, the Nilgiri became bankrupt while the Delhi-Ambala-Kalka and the Bengal Central eventually received a guarantee; the fourth — the Bengal and North Western — had the Tirhut Railway leased to it.

In the Indian States, a beginning was made with the Nizam's State Railway, a length of 531.3 km.

Upto the year 1870, when the first change in policy took place, 6,848 km. had been opened for traffic, of which all but 72 km. were on the broad gauge. During the next ten years, that is, upto the end of 1879, 6,822 km. were added to the railway system, the total opened to traffic being 13,670 km., of which 10,560 km. were on the broad gauge, 3,000 km. on the metre gauge and about 108 km. on narrower gauges. The need for a more rapid extension of railways was stressed by the famines of Bihar (1874) and the Deccan (1876). The diversion of a portion of the Famine Insurance Grant for expenditure on railways of a protective or productive nature, being small, did not assist matters and the progress continued to be slow. By 1883, however, the finances of the country had considerably improved and raising the limit of borrowing from Rs. 2 crores to about Rs. 3 crores enabled quicker progress only for a time, as after the Panjdeh incident in 1885, funds had to be diverted to the construction of costly strategic and unremunerative railways on the North-West Frontier. In 1890, the whole available balance of the Famine Insurance Grant was devoted to railway construction and in 1892 half a crore was specially added to capital expenditure to finance new lines of railway and extensions.

In view of the adverse effects of the falling exchange, Government wanted to replace the gold liabilities involved in the guarantee by the introduction of rebate terms and resort again to the companies. Despite the attempts to make the terms as favourable as possible, short of a direct guarantee, one concession after another lapsed. The Indian States provided part or whole of the funds required for railways passing through their territory, in some cases from revenues of the States, in

others from loans to them by the Government or on the Government guaranteeing loans made to a State by a company. The total length constructed in this way amounted to 5,855 km., but these expedients could not be relied on for a steady supply of funds for the development of the railway system.

The easier and cheaper means of transport afforded by the railways, the opening of new lines and the construction of feeder roads added greatly to the business of the trunk lines. The need for the provision of improved facilities to cope with this increasing business had steadily grown. While the demand for new lines all over the country was urgent, little money could be made available for expenditure on open lines, with the result that the latter were starved. Famines, frontier wars and a falling exchange prevented funds being provided for a wider development of the railway system. The expenditure incurred on railways constructed by the agency of guaranteed companies had been kept apart from the Government allotments and was not affected by the exigencies of Government finances. But the continued fall in exchange, however, made it necessary for the Government to take cognizance of all capital liabilities; and since 1896 the expenditure not only by the railways owned by the State but also by those guaranteed by it was included in the railway programme. The capital budget programme necessarily required to be increased and an improvement in exchange as a consequence of closing mints to the free coinage of silver made this possible.

**Growth of Railway Traffic, 1853-1900:** During 1853-1900, the growth of the railway system and of the traffic carried by it presents, as far as they go, an impressive record. The capital outlay on the railway increased from Rs. 38 lakhs to Rs. 330 crores, and the kilometrage open from 32 to 39,835 km. The gross earnings rose from less than a lakh to over Rs. 31½ crores, and the working expenses from less than half a lakh to more than Rs. 15 crores. The net earnings increased from about half a lakh of rupees to about Rs. 16½ crores.

The volume of passenger and goods traffic registered a no less striking increase. The number of passengers went up from 19 millions in 1871 -- figures for the previous years are not available -- to 176 millions in 1900. Passenger earnings during this period advanced from Rs. 202 lakhs to Rs. 895 lakhs. As regards goods traffic, the tonnage moved during the period 1875-1900, increased from 3.5 millions to 42.90 millions. Goods earnings amounted by the year 1900 to Rs. 20 crores, as against Rs. 4.2 crores in 1871.

During the fifteen years 1885-1900, the tonne kilometrage had almost doubled to 10,696 million. Passenger kilometrage had gone up from 5,858 to 11,000 million.

The average freight rate per tonne per kilometre gradually decreased

from 6.75 pies (3.5 *paisa*) in 1875 to 3.65 pies (1.9 *paisa*) in 1900. The average fare per passenger per mile (1.60 km.) — available from 1885 only — remained almost constant in the neighbourhood of 2.50 pies (1.6 *paisa*).

TABLE I  
Railway Development During 1853-1900

|                                | 1853 | 1860   | 1870            | 1880            | 1890   | 1900   |
|--------------------------------|------|--------|-----------------|-----------------|--------|--------|
| Route kilometrage              | 32   | 13,486 | 7,678           | 14,778          | 26,400 | 39,835 |
| Capital outlay (Rs. lakhs)     | 38   | 2,666  | 9,001           | 12,857          | 21,367 | 32,953 |
| Gross earnings (Rs. lakhs)     | 0.9  | 67     | 667             | 1,287           | 2,067  | 3,154  |
| Working expenses (Rs. lakhs)   | 0.4  | 37     | 363             | 648             | 1,030  | 1,509  |
| Net earnings (Rs. lakhs)       | 0.5  | 30     | 304             | 639             | 1,036  | 1,645  |
| Passenger earnings (Rs. lakhs) | --   | --     | 202<br>(1871)   | 457             | 626    | 895    |
| Goods earnings (Rs. lakhs)     | --   | --     | 420<br>(1871)   | 923             | 1,300  | 2,038  |
| No. of passengers (million)    | --   | --     | 19.28<br>(1871) | 49.16           | 114.08 | 178.31 |
| No. of tons (million)          | --   | --     | 3.54<br>(1871)  | 10.39           | 22.61  | 42.90  |
| Passenger kilometres (million) | --   | --     | --              | 4,664<br>(1882) | 7,691  | 11,008 |
| Tonne kilometres (million)     | --   | --     | --              | 4,006           | 5,739  | 10,867 |

Towards the close of the century, the kilometrage open was 22,370 under broad gauge, (5' 6") 16,270 under metre gauge (3' 3-3/8") and 1,122 under narrow gauges (2' 6" and 2' 0").

The development in both passenger and goods traffic required more rolling stock, larger stations and goods sheds, additional sidings and stations, and sometimes duplication of the permanent way. The increasing demand for a faster and better train service, if the safety of the travelling public was to receive due consideration, necessitated expenditure on interlocking plant and automatic brakes. The difficulties of the railways in properly conducting their business finally became so great that in 1901 it was decided to adopt the principle of regarding the needs of open lines to meet their growing traffic as the first charge upon the funds available; next, in order, provision was made for the steady prosecution and early completion of lines in progress, preference being given to companies' lines over those

under construction by the agency of the State. After these needs had been met, the claims of new lines were to be considered.

The complexion of the railway systems themselves had undergone by this time a substantial change. The old guaranteed lines had been purchased by the State: the East Indian in 1880; the Eastern Bengal in 1884; the Sind, Punjab and Delhi in 1886; the Oudh and Rohilkhand in 1889; and the Great Indian Peninsula in 1900. Of these, the East Indian and the Great Indian Peninsula were again leased to companies to work, while the others were taken over and worked as State railways. Of the original lines constructed under a guarantee, only two were worked under their old contracts, namely, the Bombay, Baroda and Central India Railway and the Madras Railway. The former was taken over by the State at the end of 1905 and the contract of the latter was terminated in 1907. Many of the railways constructed and for some time worked by the State had been leased to companies or to lines owned and worked by the Indian States.

In purchasing these old guaranteed lines, payment was usually made in the form of terminable annuities which became a charge against the revenues of the railways. As these annuities represented not only interest charges but also the amount payable in redemption of capital, the railway returns appeared worse than they actually were. The great development in traffic, however, counteracted this effect of the annuity charges and annuity payments, and every other liability, and the Government started making a handsome profit from its railway property since 1900-1901. The construction of canals in the Punjab, and the colonization of districts served by them, added so enormously to the traffic of the North-Western Railway as to convert it from an unremunerative line to one yielding large profits. The new kilometrage added from year to year opened up new country and the improvement in the means of communication developed resources and brought new business to the old lines.

**Metre Gauge Lines:** Although originally the metre gauge lines were built as light railways, the traffic which they were called upon to carry proved so much heavier and developed so much more rapidly than had been anticipated that it was soon found that something more substantial must be provided if they were to fulfil their purpose. To increase the capacity of the metre gauge was a great deal less costly than to convert it to the broad gauge; and, as funds continued scarce, the former course was adopted. These two factors, the cheapness of construction and the expense of conversion to broad gauge, exercised so great an influence on the policy of the Government that it had seldom been found possible to adopt the original idea of converting the metre gauge as soon as the traffic justified the change.

For thinly populated areas, and for short lines of purely local importance, a gauge narrower than the metre gauge was adopted as the most suitable means for developing the resources of the country.

A break of gauge, always a drawback, could, during periods of pressure, such as in the export season, at times of famine, and during extensive military movements, be extremely inconvenient. But the evil had reached such dimensions — at the end of 1900 there were open for traffic 16,270 km of metre gauge railway as compared with 22,370 km on the broad gauge — that the remedy was far from simple.

**Report by Special Commissioner for Indian Railways:** It had by now become necessary to examine the adequacy of the existing administrative machinery for dealing with the railways. In October 1901, a Special Commissioner for Indian Railways, Mr. (later Sir) Thomas Robertson, was appointed to enquire into, and report on, the general administration and working of Indian Railways. His studies and recommendations emphasized the need for a more effective form of Central organization for Government control of the Indian Railways. In pursuance of his recommendation, the Railway Board was formally constituted in March 1905, and placed outside of, but subordinate to, the Government of India and represented in the Viceroy's Council by the Member in-charge of the Department of Commerce and Industry. The duties assigned to the Railway Board were of two kinds. Its deliberative functions included the preparation of the railway programme of expenditure and the discussion of the larger questions of railway policy and economy affecting all lines, the final authority for decisions in regard to which was still retained by the Government of India. Its administrative duties included the construction of new lines by State agency, the carrying out of new works on open lines, the improvement of railway management with regard to both economy and public convenience, the arrangements for through traffic, settlement of disputes between lines, the control and promotion of staff on State lines and the general supervision over the working and expenditure of companies' lines. The final authority in regard to these administrative duties was delegated, subject to certain restrictions, to the Railway Board.

The change thus inaugurated was the most important that had been made in regard to policy and administration since railways were first introduced into India. The principle of consolidating several railway undertakings under one management, which had been so largely adopted in England and America, was followed in India also; and this added to the great development of business and showed the need for some change in the system of administering the Traffic Department. On the larger railways, the department was split up into 'Commercial' (the procuring of traffic) and 'Transportation' (the handling and haulage of traffic).

**Committee on Railway Finance and Organization, 1907:** The demand for railway expansion continued, but the expenditure on new constructions fell far short of popular expectations. The Secretary of State for India appointed in 1907 a Committee on Railway Finance and Administration, with Sir John Mackay as Chairman, to examine the country's requirements of new railways and explore means for financing such new constructions. Since 1900 the annual losses on railway account had disappeared and the gain to the State from its railway investment had become a regular feature. The fact of Indian railways being a paying proposition was commented upon by the Mackay Committee which, referring to the inadequacy of rail transport and the urgency of large scale constructions, expressed the view that even a total route mileage of 100,000 (1,61,000 km.) was short of that which would ultimately be found to be necessary in India and 'the steady' and even rapid development of the railway system of India should be regarded by Government as one of its important duties'. A sum of £100 million was accordingly recommended to be spent on new constructions and development in the next eight years.

New constructions, however, continued to progress at a much more modest pace, as only about 16,100 km. were added to the railway system during the period 1900-14. This was a good deal less than the increase in the route mileage during the preceding fifteen years. The progress of new construction was nevertheless fairly steady till the developments during the First World War slowed it down.

**World War I and After:** Indian railways made an important contribution to World War I by diverting as much of their resources as possible to meet the military requirements. The transportation of troops, materials and supplies at short notice cast a heavy burden on the railways. Many sections of railway workshops were also set apart for the production of war equipment. As overseas supplies of railway materials and components from the United Kingdom, the principal supplier, were cut off, arrears of maintenance and renewals accumulated and the railway assets were reduced to a serious state of attrition. At the end of the war, the transport situation had become so grave that all interests concerned with agriculture, trade and industry were unanimous in demanding drastic and emergent steps to rehabilitate the Indian railway system to meet the economic requirements of the country.

At about the same time certain important matters of future railway policy were awaiting early consideration. The contract with the East Indian Railway was due to expire in 1919. Public opinion had consistently declared its preference for State management and was not satisfied with railways in India being managed any longer by the English-domiciled companies with Boards of Directors in London. For one

thing, there appeared no reason why these companies should continue to obtain recruits from overseas for almost all the higher posts when good material was already available in the country. Then there was the question of industrialization of the country and the contribution that the railways could make towards accelerating its pace. Government management, it was held, would tend towards a more positive policy for effective domestic industrial development than the continuation of company management with its natural bias towards its vested interests and maximization of dividends to its shareholders. Also, procurement of railway stores afforded a valuable opportunity for encouraging domestic industries by giving them a degree of preference. It was felt that the company-managed railways, with their Boards of Directors in England, could not be expected to respond readily to such developmental policies, whereas State management would be more sympathetic towards economic advancement in the country. Finally, Government would recognize more readily than the companies the need for improving the conditions and amenities for the third class passengers. The force of public opinion in favour of State-managed railways had gained strength and this, coupled with the impending constitutional changes, led to a decision to postpone any far-reaching changes until a comprehensive enquiry was undertaken into all aspects of the question.

**Railway Working Results, 1901-1920:** The results of working of Indian railways for select years during 1900-1920 are shown in the Table below:

TABLE II  
Results of Working of Indian Railways, 1901-20  
(Select Years)

(Rs. in lakh, other figures in million)

|                      |     | 1901   | 1905   | 1910   | 1915-16 | 1919-20 |
|----------------------|-----|--------|--------|--------|---------|---------|
| Route kilometrage    |     | 40,768 | 45,537 | 51,659 | 57,668  | 57,119  |
| Capital outlay       | Rs. | 33,517 | 33,852 | 43,905 | 53,298  | 56,633  |
| Gross earnings       | Rs. | 3,360  | 4,170  | 5,114  | 6,466   | 8,915   |
| Working expenses     | Rs. | 1,572  | 1,995  | 2,116  | 3,292   | 5,066   |
| Net earnings         | Rs. | 1,788  | 2,175  | 2,399  | 3,174   | 3,849   |
| No. of passengers    |     | 195    | 248    | 372    | 464     | 520     |
| Passenger kilometres |     | 12,548 | 15,933 | 21,617 | 26,601  | 33,177  |
| No. tonnes of goods  |     | 43.7   | 56     | 66     | 83.3    | 89.4    |
| Tonnes kilometres    |     | 11,548 | 14,784 | 19,774 | 28,056  | 33,631  |
| Passenger earnings   | Rs. | 1,007  | 1,274  | 1,712  | 2,099   | 3,361   |
| Goods earnings       | Rs. | 2,123  | 2,021  | 3,043  | 3,876   | 4,712   |

**East India Committee 1920-1921:** In 1920 the East India Railway Committee was appointed, with Sir Williams M. Acworth as Chairman, to undertake a comprehensive enquiry into questions relating to the management, finance and future control and organization of the railways. The Committee, after a detailed enquiry, recommended by a majority the termination of the contracts with the companies as they fell due. The financial policy of the Government of India, which made no provision either for reserves or for ensuring a steady flow of funds for financing railway construction, improvements, etc., came in for criticism, and, in order to ensure a sound financial policy, keeping in view the developmental needs of the country, and to free the railways from the effects of fluctuations in the general finances of the country, the Committee recommended the separation of the Railway budget from the Central budget of the country. The need for making adequate provision for depreciation and limiting the demands of the State on railway surpluses was also stressed. On a number of other subjects of topical interest, such as Indianization of the higher cadres of the railway services, stores purchases, rating policy, etc., the Committee were generally in agreement with informed public opinion.

The East India Railway Committee's recommendations were accepted by the Government and, by a Resolution passed on September 20, 1924, in the Central Legislative Assembly, Railway finance was separated from the General finances. The Railway Board was reorganized, with a Chief Commissioner and a Financial Commissioner, besides the technical Members. The technical Directorates were also strengthened and expanded. As regards the policy of State management, the Government was already operating three railway systems, namely, the North-Western Railway, the Oudh and Rohilkhand Railway and the Eastern Bengal Railway. On January 1, 1925, the East Indian Railway was taken over by the State and merged with the Oudh and Rohilkhand Railway. On May 1, 1925, on the expiry of the contract, the Great Indian Peninsula Railway Company was also taken over under State management. Thus, by 1929, five major systems — including the Burma Railways taken over in the same year by the Government — were operated under direct State management.

The first six years after the adoption of the convention instituting a separate budget for the Railways witnessed the introduction of a series of important changes in finance and organization. A proper depreciation fund was set up on the basis of the recommendations of a Depreciation Fund Committee. The system of accounts and statistics was examined by Sir Arthur Lowes Dickinson, and a beginning was made towards the separation of accounts from audit. The administrative organization of the individual railways was also overhauled, and in the

case of the larger systems, namely, the North-Western and the East Indian Railways, the divisional system of working replaced the former district system. A more progressive policy designed to improve the conditions of railway labour was adopted. In order to provide a proper machinery for the adjudication of rates disputes, a Rates Advisory Committee was established. Amenities to the travelling public, specially the third class passengers, were steadily extended and improved.

**Railway Development during 1924-30:** The requirements of railway development received detailed consideration. Programmes of open-line improvements and of new construction were drawn up and large additions were made each year to the route mileage. The capacity of certain intensively worked lines was increased by doubling and quadrupling, and by improved signalling. The plans of rehabilitation and modernization included the improvement of the permanent way, strengthening of bridges, remodelling of yards, new station buildings, more staff quarters, etc. Several of the workshops were extended and their equipment improved. The electrification of the suburban services in Bombay and Madras City areas was undertaken during this period. The total capital outlay incurred on all these items on the State-owned lines during 1924-1932 amounted to Rs. 122.89 crores. The construction of new lines alone amounted to an addition of 8,630 km. at a capital expenditure of about Rs. 44.90 crores.

Railway revenues tended to be buoyant. Gross traffic receipts of the State-owned railways (excluding worked lines) rose from Rs. 100.13 crores in 1924-25 to Rs. 103.73 crores in 1928-29. After meeting the operating expenses and providing for depreciation, the net traffic receipts plus the miscellaneous receipts were sufficient to meet the interest charges in full and the payment of the contribution to the general revenues. As on March 31, 1930, the balances in the Depreciation Fund and the Reserve Fund amounted, respectively, to Rs. 12.24 crores and Rs. 16.35 crores.

**Impact of World Depression:** The years of prosperity came to an unexpected and abrupt end with the world crisis, the impact of which was felt in 1931. Railway receipts, following the general depression in agriculture, industry and trade, declined steeply, from Rs. 102.70 crores in 1929-30 to Rs. 86.63 crores in 1931-32 and to Rs. 84.43 crores in 1932-33. Retrenchment of expenditure and staff had to be enforced in order to keep down the losses in working. The accumulations in the Reserve Fund were almost wiped out within two years and, besides suspending the payment of the contributions to the General Revenues, the Depreciation Fund had to be raised to the extent of Rs. 30.28 crores since 1931-32 in order to meet the interest charges on capital. It was only in 1937-38 that the situation improved slightly. The deterioration in the

financial results of the railways and the volume of traffic may be seen from the figures given in the following Table.

TABLE III

## Results of Working of Indian Government Railways, 1924-1937

(Rs. in crores, other figures in million)

| Goods tonne,         | 79      | 88      | 84      | 72      | 78      | 87      |
| Tonne kilometres     | 34,778  | 35,197  | 33,367  | 28,130  | 30,589  | 35,050  |

**Effects of World War II and Partition:** These depressing financial trends were reversed when, towards the end of the decade, the traffic demands of World War II brought in increased earnings from 1939-40 onwards. These produced in the succeeding years surpluses which more than made up for the loans previously taken from the Depreciation Fund to meet the deficit in the thirties as well as to pay off the contributions then suspended. From 1940-41 onwards all past records of traffic receipts, net earnings and surpluses were broken. These were the results of the equally striking increases in passenger traffic and goods traffic, as shown in Table IV. After payment of the interest charges and the contributions to the General Revenues, the surpluses were quite substantial as evidenced by the balances, as on March 31 1947, of Rs. 23 crores in the Revenue Reserve Fund and Rs. 14.83 crores in the Betterment Fund. These were in addition to the Rs. 108.24 crores of the balance in the Depreciation Fund.

World War II, more protracted than its predecessor, inflicted on the railways for greater wear and tear. The attrition of assets due to intensive use and postponement of renewals, and even of essential maintenance, due in many cases to lack of resources, left Indian Railways in an even more serious state of disrepair than in 1918. When they emerged from the depression by 1937, the railways had before them the problem of overtaking the arrears of maintenance and replacements since 1931. But the outbreak of the Second World War in 1939 interrupted the natural course of achieving this as overseas sources of supply had diverted their production to meet the exigencies of war.

During the first phase of the war, Indian Railways, despite their accumulated deficiencies and difficulties, were called upon to release locomotives, wagons and track material for the Middle East for which the Indian command had the defence responsibility. Over 8 per cent of the metre gauge locomotives and 15 per cent of the metre gauge wagons of the Indian Railways, as well as 6,440 km. of track and 4 million sleepers, were released for military purposes. This necessitated the dismantling of 26 branch lines as well as the curtailment of services on many others. Later, when India had become the base for mounting a major offensive against Japan, the load on the railways increased still further. A large number of railway workshops were diverted to the manufacture of munitions while the maintenance and renewal of railway equipment received little attention. The continuous strain imposed on the railways by demands for heavy military movements brought them almost to breaking point. Considerable arrears of renewals and replacements accumulated and indigenous facilities for rehabilitation were appreciably reduced, or incapacitated by the mobilization of workshop equipment for the war effort.

The results of railway working during 1938-39 to 1946-47 may be seen from the figures for select years in the following Table:

**TABLE IV**  
**Financial Results of Working of Class I/Government Railways 1937-38 to 1946-47**  
(Select years)  
(Rupees in crores, other figures in millions)

|                        | 1937-38   | 1938-39 | 1939-40 | 1940-41 | 1944-45 | 1945-46 | 1946-47 |
|------------------------|-----------|---------|---------|---------|---------|---------|---------|
| Gross earnings         |           |         |         |         |         |         |         |
|                        | Rs. 103.5 | 103.5   | 107.8   | 122.4   | 226.0   | 237.3   | 215.4   |
| Total working expenses | Rs. 66.8  | 66.8    | 69.8    | 70.7    | 145.6   | 165.9   | 175.1   |
| Net earnings           | Rs. 34.7  | 34.7    | 38.0    | 51.7    | 80.5    | 71.4    | 40.4    |
| Volume of traffic:     |           |         |         |         |         |         |         |
| No. of passengers      | 499       | 499     | 499     | 542     | 872     | 986     | 1,078   |
| Passenger kilometres   |           | 28,917  | 28,635  | 30,784  | 58,526  | 64,448  | 65,389  |
| Goods, tonne           |           | 85      | 89      | 90      | 99      | 99      | 89      |
| Tonne kilometres       |           | 35,776  | 37,923  | 40,858  | 45,889  | 47,163  | 43,625  |

A redeeming feature of rail transportation during World War II from the financial point of view was that both the Depreciation and the Reserve Funds were well stocked with large balances to meet future expenditure, as little could be purchased during the war. Another important development during the period covered by the war was that the remaining company-managed railways, about the taking over of which by the State the decision had been postponed during the thirties, were all brought under State management. The acquisition of these British companies' lines afforded an opportunity to use some of the rapidly accumulating sterling balances to good purpose. The Assam Bengal Railway was taken over on January 1, 1942 and merged with

the Eastern Bengal Railway to form the Bengal Assam Railway. The Bombay, Baroda and Central India Railway was acquired by the State on January 1, 1942. The Bengal and North-Western Railway and the Rohilkhand and Kumaon Railways were taken over and brought under State management as the Oudh and Tirhut Railway, as from January 1, 1943. The acquisition of the Madras and Southern Mahratta Railway and the South Indian Railway took place on January 1, 1944. The Bengal Nagpur Railway was also acquired by the State as from October 1, 1944. In regard to both the South Indian and the Bengal Nagpur Railways, the taking over was well ahead of the due dates of the expiry of the contracts, namely, 1945 and 1950.

When the hostilities ceased the railways were faced with major problems not susceptible of immediate solution. Plans for post-war rehabilitation and development were necessarily long-term, but most of these were stultified by the effects of the partition of the country which led to the dismemberment of the North-Western Railway and the Assam-Bengal Railway, and the transfer of 11,166 km. and the corresponding equipment to the newly constituted State of Pakistan. In addition to the problems of reorganizing the parts of these systems which fell in Indian territory into self-sufficient units and complicated staff changes, there were the formidable difficulties caused by the mass migration from one Dominion to the other.

The termination of the war in 1945 faced the Indian Railways with problems of large scale rehabilitation, which were aggravated by the enormous increase in the volume of traffic referred to earlier. The railways were handicapped by the fact that a considerable proportion of the locomotives, coaching vehicles and wagons were overage and obsolete. The track had deteriorated to an extent that necessitated severe speed restrictions. All these factors had their inevitable repercussions on the general efficiency of the transport system: restricting capacity, slowing down of the movement of trains, frequency of engine failures, and making the imposition of priorities essential.

The partition also affected the railway network. The parts of the North-Western Railway and the Bengal Assam Railway which were left on Indian territory had to be integrated into workable units connected with the main system. Some of the lines, as those in Assam, were completely cut off from the rest of the country. The pattern of traffic was also altered by the loss of the port of Karachi and this added to the burden on the Delhi-Bombay route, which consequently stood in need of augmentation of line capacity, improvement of yard facilities, and readjustment of many other essential operational arrangements.

**Developments since 1948:** The shock of the partition was, however, mostly absorbed by the middle of 1948, but other factors continued to

strain the transport system to the utmost and created several bottlenecks. The traction position called for urgent attention. Large orders were placed with early delivery dates for locomotives, and the timely arrival of these contributed to a noticeable improvement. Simultaneously, efforts were made to set up in the country a modern locomotive manufacturing industry for the Indian Railways designed for an output of 120 locomotives per annum plus spares, boilers and other components. The erection of the factory, the Chittaranjan Locomotive Manufacturing Works, was completed within two years of commencement and it started production in 1951. The Tata Engineering and Locomotive Company, a private company in which Government acquired shares, produced metre gauge locomotives and boilers.

The shortage of coaching vehicles was the main obstacle to affording relief to overcrowded trains. Railway workshops and the unused capacity of the Hindustan Aircraft Factory at Bangalore were utilized to produce more coaching vehicles. A new coach-building factory was built at Perambur, near Madras, to manufacture an improved type of passenger coaches.

Following the attainment of independence, a number of far-reaching changes in railway organization and policy were carried out. The basis of rates and shares was revised thoroughly and the new system was brought into force in January 1948. Passenger fares which used to vary in the past from railway to railway were standardized throughout the country. The revision of freight rates was more difficult, but the necessity for rating reforms had been recognized for some time past. A Post-War Rating Committee had been set up to undertake a detailed examination of existing rates and make recommendations regarding the changes to be introduced. The revised rates which incorporated many of these recommendations on comprehensive lines came into force with effect from October 1, 1948. As a result of these changes, the highly individualistic character of some rates was modified and a telescopic bias was imparted to the class rates — a reform long pressed for by the commercial community. The difference between the rates on railway risk and owner's risk conditions, which was rather wide under the previous classification, was now narrowed down to about the difference between two successive classes. The large number of special rates was considerably reduced and the terminal charges were standardized.

The machinery for the adjudication of rates disputes was also overhauled at the same time. The former Railway Rates Advisory Committee could only recommend; it had no power to enforce its decisions on the railway administrations. Its intervention was not, therefore, invoked by the trading community as frequently as it might have been owing to this limitation. In 1948, the Indian Railways Act was amended

and provision was made for the setting up of a Railway Rates Tribunal with mandatory powers.

It was logical that the political independence of the country should create an urge for self-sufficiency on the part of the railways in the technical field. After a careful assessment of the talent available, it was decided in 1949 to form Design and Consultant Wings from the engineering cadres of railways in India to replace a well-known firm of British consulting engineers, who had given technical guidance for the past three quarters of a century. Indian railways were fortunate in having with them civil and mechanical engineers of high calibre, with aptitude and experience in this line of work. A proper organization of Locomotive, Carriage and Wagon, and Structural and Permanent Way Design and Consultant Wings, manned by Indian officers, was thus set up.

Another important event was the revision in 1949 of the convention separating railway finance from general finance. The original convention of 1924 was intended to be reviewed after three years, but this review had been postponed from time to time for various reasons. The only change brought about during the 25 years since its adoption was the amendment in 1943 of one of the clauses relating to the contribution under which, instead of a specified formula, Government was empowered to fix it from year to year from 1944-45 onwards. There were some other features of the old convention which had become out of step with post-war conditions and requirements of the country. A Committee of Parliament went into the whole question and made a number of important recommendations which were generally accepted. According to the revised convention of 1949 contributions to the General Revenues were abolished. Instead, a dividend of 4 per cent per annum on the loan capital invested, as computed annually, was payable to General Revenues. The contribution to the Depreciation Reserve Fund was increased to a minimum of Rs. 15 crores a year in recognition of the high costs of replacement at post-war levels of prices. The financial limit for charging to Revenue the cost of minor additions and improvements was raised from Rs. 10,000 to Rs. 20,000 for each individual item. A special provision was also made to cover expenditure on unremunerative projects for improving operational efficiency in excess of Rs. 3 lakhs, such costs being charged to a Railway Development Fund intended to finance passenger amenities, staff welfare works and projects which were necessary but were financially unremunerative at the time of construction. Finally, the scope of the Reserve Fund was limited to securing payment of prescribed dividends and to bridging the gap, should any occur during the period of the convention, namely, five years. The revised convention was an advance on the original convention and provided correctives to any tendency to over-capitalization.

The regrouping of Indian Railways on a rational and geographical basis, which had been the subject of consideration for more than a quarter century, had by 1949 reached a stage where it could no longer be postponed. The cutting up of the North-Western Railway and the Bengal Assam Railway, as a result of the partition of the country, had left certain sections within India, which were, relatively, too small and poorly equipped with workshops and other resources for economical working. After the Federal Financial Integration of the Indian States on April 1, 1950, the railways belonging to these States, varying from 6.44 km. of the Sangli State to 2,254 km. of the Nizam's State, had become parts of the Indian Government Railway System. The reorganization of all these lines to form a smaller number of larger and more resourceful systems was thus imperative in order to bring about improved standards of working, uniformity in operational arrangements and procedures, extension of facilities and reasonable amenities for the travelling and trading public. As the result of detailed and expert consideration of the question and after taking into account the views of the public and the Parliamentary Committee, the Railway Board carried out its plan of reorganizing the integrated Indian Railway system into six administrative and operating zones.

The first regrouped railway to be formed was the Southern Railway on April 14, 1951, comprising the Madras and Southern Mahratta Railway, the South Indian Railway and the Mysore Railway with headquarters at Madras. On November 6, 1951, the Central Railway and the Western Railway were formed with separate headquarters, but both located at Bombay. The former absorbed the Dholpur and the Scindia State Railways as well as the Nizam's State Railway into the Great India Peninsula Railway; and the latter the Saurashtra Railway, the Jaipur Railway, the Rajasthan Railway and the Kutch State Railway into the Bombay, Baroda and Central India Railway. The final phase of the programme of regrouping was completed on April 14, 1952, when the Northern Railway, the North-Eastern Railway and the Eastern Railway were formed. The Northern Railway represented the fusion of the Eastern Punjab Railway, the Bikaner Railway and the Jodhpur Railway within the Allahabad, Lucknow and Moradabad divisions of the East Indian Railway with headquarters at Delhi. The North-Eastern Railway was a case of simple amalgamation of the Oudh and Tirhut Railway and the Assam Railway, with headquarters at Gorakhpur. The remaining divisions of the East Indian Railway were combined with the Bengal Nagpur Railway to form the Eastern Railway with headquarters at Calcutta. The route kilometrage of each regrouped railway is given in Table V.

The executive and administrative organization of the constituent units was left largely undisturbed. In the case of the Southern, Western

TABLE V

| <i>Railway</i> | <i>Route Kilometrage</i> |
|----------------|--------------------------|
| Central        | 8,736                    |
| Eastern        | 9,120                    |
| North-Eastern  | 7,704                    |
| Northern       | 9,667                    |
| Southern       | 9,684                    |
| Western        | 9,062                    |

and North-Eastern Railways, based on the district system of working, three regional headquarters were established for each zone under the control of regional Deputy Heads of Departments for intermediate co-ordination and supervision. On the other railways the constituent units were moulded to the predominating divisional pattern. Only on the Eastern Railway was there a combination of the two, the old East Indian Divisions being retained as such along with the district organization of the Bengal Nagpur Railway controlled through a region at Bilaspur. This policy had the advantage of avoiding any dislocation in the actual working.

Indian railways have had to plan their programmes of rehabilitation, improvement and new construction within the limitations of finance and indigenous resources. New constructions have been few in spite of many demands in the country. The Assam Rail Link and the connection from Deesa to the new port of Kandla, each about 290 km. in length but traversing widely different country, were about the only larger lines to be taken up. Rehabilitation of the major assets and the improvements necessary to obtain optimum performance from the existing resources were given the highest priority in the capital programmes. Most of the lines dismantled during the war were restored and many proposals for new construction intended to provide additional carrying capacity were considered. With effect from 1950-52 the railway programmes were gradually dovetailed into the Five Year Plans referred to later in this section.

Among other developments should be mentioned the celebration by the Indian Railways in 1953 of the completion of 100 years of working. A Centenary Railway Exhibition was organized displaying the old and the new stock, the products of the post-independence enterprise, such as the domestically manufactured locomotives, passenger coaches and wagons, additional passenger amenities, and the contribution of Indian industry towards national self-sufficiency in railway requirements. A commemoration volume entitled "Indian Railway — One hundred Years" was brought out on the occasion.

Representation of interest groups in the Railway Local Advisory Committees had for many years past afforded railway administrations a means of ascertaining public opinion regarding the services rendered

by them to the users. With a view to bringing the machinery more in line with current requirements by providing increased opportunities of associating the public with the railways, the Railway Users Consultative bodies were established during 1953-54 on a federalized pattern at divisional/regional, zonal and national levels representing all important interests.

In view of the prospective developments under the Second Five Year Plan, the division of the Eastern Railway was considered desirable and, accordingly on August 1, 1955, the Railway was bifurcated, the Bengal Nagpur Railway portion with slight adjustments in the Adra District jurisdiction forming the South-Eastern Railway, and the rest of the system upto Mughal Sarai and the Sealdah Division becoming the new Eastern Railway. On January 15, 1958, the North-Eastern Railway was also bifurcated. With a view to providing the eastern-most part of India with a suitable administrative machinery competent to deal promptly and effectively with the immediate as well as the long-term railway problems, it was felt that a full-fledged and viable railway administration with headquarters at Pandu was necessary. The lines comprising the Pandu Region (with the exception of a few branch lines), 2,778 route kilometres in length, was formed into the North-East Frontier Railway. The remaining lines, 6,397 route kilometres in length constituted the North-Eastern Railway. On October 2, 1966, the South Central Railway was formed from out of parts of the Southern Railway and the Central Railway with a route kilometrage of 6,088. There are thus nine railway systems as from 1966.

The freight structure underwent important changes as the result of the recommendations of the Freight Structure Enquiry Committee 1955-57. The risk rates differentiation was abolished and the class rates were placed on a new basis. The Rates Tribunal was reconstituted on the lines of the recommendations of the Committee.

**Railway Plans:** Indian Railways, which since 1930 had been seen little beyond a shrinkage in their network, entered into a period of dynamism and active development under the impact of the Five Year Plans. The projects included in these Plans involved a steadily increasing demand for rail transport therefor and new facilities, improvements and additional lines for the capacity to be planned and provided in advance so as to be available when required. The expenditure incurred on the three Railway Plans have shown a steady increase as in Table VI.

As the First Five Year Plan for the Railways was more one of rehabilitation after the war, the next two plans afford a better picture of the effect of the national plans on railway development and improvements as will be seen from Table VII.

TABLE VI  
Railway Plan Outlay on the Three Plans and During 1966-69

|                                 | (In Rs. crores) |
|---------------------------------|-----------------|
| First Plan, 1951-52 to 1955-56  | 423.23          |
| Second Plan, 1956-57 to 1960-61 | 1,043.69        |
| Third Plan, 1961-62 to 1965-66  | 1,763.65        |
| Annual Plans, 1966-69           | 734.30          |

TABLE VII  
Second and Third Plan Outlays on Railways

|                                               | (In crores of Rs.) |            |
|-----------------------------------------------|--------------------|------------|
|                                               | Second Plan        | Third Plan |
| Rolling stock                                 | 372.62             | 531.00     |
| Machinery and plant                           | 17.00              | 30.00      |
| Track renewals                                | 188.84             | 170.00     |
| Bridge works                                  | 24.83              | 25.00      |
| Ganga Bridge                                  | 7.23               | —          |
| Traffic facilities                            | 173.44             | 249.00     |
| Signalling, interlocking, etc                 | 17.31              | 30.00      |
| Workshops                                     | 28.10              | 32.00      |
| Electrification                               | 53.77              | 105.00     |
| Staff quarters                                | 37.86              | 35.00      |
| Staff amenities                               | 11.32              | 15.00      |
| Passenger and other users, amenities          | 14.71              | 15.00      |
| New lines and restoration of dismantled lines | 77.83              | 147.00     |
| Investment in road services                   | 5.34               | 10.00      |
| Other specified works                         | 30.39              | 15.00      |
| Miscellaneous                                 | 16.90              | 35.00      |

The striking increase in the volume of traffic during the period covered by the decade 1956-57 to 1965-66 may be seen from the statistics given below:

TABLE VIII  
(Figures in millions)

|                                 | Passengers<br>Originating | Passenger<br>km. | Tonnes<br>Originating | Tonne<br>km. |
|---------------------------------|---------------------------|------------------|-----------------------|--------------|
| 1950-51 (Pre-Plan Year)         | 1,284                     | 66,517           | 93.0                  | 44,117       |
| 1955-56 (Last year of 1st Plan) | 1,527                     | 62,400           | 115.9                 | 59,576       |
| 1960-61 (Last year of 2nd Plan) | 1,594                     | 77,665           | 156.2                 | 87,680       |
| 1965-66 (Last year of 3rd Plan) | 2,082                     | 96,294           | 203.1                 | 116,936      |
| 1968-69                         | 2,213                     | 106,940          | 204.0                 | 125,140      |

In view of the difficulties of coping with anticipated increases in traffic with steam traction in the regions where the coal-fields and the new steel plants are situated, it was recognized that electrification and dieselization had become an operational necessity. Provision was accordingly made for the electrification of a number of sections on the Eastern, South-Eastern, Central and Southern Railways. Apart from the suburban electrification at Calcutta, extension to main line brought the total route kilometrage electrified by the end of 1962-63 to 1,228 (150 km. on the D.C. and 1,078 km. on the 25 kv A.C.) against a total of 2,845 programmed by the end of the Third Plan. The electri-

fication on the Eastern Railway completed in 1962 upto Mughal Sarai and further extended to Allahabad and Kanpur, in addition to a number of sections adjacent to Calcutta. On the South-Eastern Railway electrification of Howrah-Tatanagar, Rourkela-Birmitrapur and other sections in the coal-fields and iron belt has been completed at different stages. The Igatpuri-Bhusaval on the Central Railway and Egmore-Tambaram-Villupuram are the other main projects in the electrification programme.

The extent of diesel traction by the end of 1962-63 is shown by the number of diesel locomotives. These amounted to 219 on the broad gauge and 60 on the metre gauge. In anticipation of the increasing dependence on diesel traction, it has been decided to undertake domestic manufacture of broad gauge main line locomotives at the diesel locomotive manufacturing works which is being set up at Varanasi with a capacity of 150 locomotives per annum. Capacity for the manufacture of electric locomotives is also being created at the Chittaranjan Locomotive Workshops. When these are completed, Indian railways will be more self-sufficient than before in regard to motive power equipment.

The Fourth Five Year Plan, 1969-74, was formulated under conditions which anticipated improvement after the recession in the economy during 1966-69, for which Annual Plans had been drawn up. The basic objectives of the Fourth Plan for the railways are to provide in full for the increase in the traffic expected, to modernize the railway equipment and practices within the limits of the funds available and to convert 1,676 km. of metre gauge to broad gauge in areas of rapid economic development and high traffic potential. Including Rs. 525 crores from the railways' own resources, the total railway outlay for the Fourth Plan has been placed at Rs. 1,525 crores.

The extent of increase in traffic and earnings during 1951-52 to 1968-69 as compared with the pre-plan year 1950-51, may be seen from the following Table.

**TABLE IX**  
**Principal Statistics of Government Railways, 1950-51 and 1968-69**

|                                                           | (Figures in million/Rs. in crores) |         |
|-----------------------------------------------------------|------------------------------------|---------|
|                                                           | 1950-51                            | 1968-69 |
| Capital-at-charge                                         | Rs. 827.0                          | 3,101.3 |
| Gross traffic receipts                                    | Rs. 263.3                          | 899.11  |
| Working expenses                                          | Rs. 215.7                          | 756.2   |
| Net revenue receipts                                      | Rs. 47.6                           | 142.8   |
| Operating ratio                                           | % 80.0                             | 82.5    |
| Percentage of net revenue receipts % to capital-at-charge | 5.75                               | 4.60    |
| No. of passengers originating                             | 1,284                              | 2,213   |
| Passenger kilometres                                      | 66,517                             | 106,940 |
| Tonnes originating                                        | 93                                 | 204     |
| Tonne kilometres                                          | 44,117                             | 125,140 |
| No. of stations                                           | 5,976                              | 7,032   |
| No. of employees (thousands)                              | 914                                | 1,354   |

### III. Roads And Road Transport

**Road Development:** Before the commencement of British rule, roadways in the modern sense were practically unknown; and even after its establishment there were few to be found, except within urban limits until 1839 when it was decided to make a strenuous effort to connect Calcutta with Delhi by means of a good metalled road suitable for wheeled vehicles, with bridges over small streams and ferries over the larger rivers. The level plains of India, scoured by streams which for eight months or more in each year were passable without difficulty by the conveyance normally used in the country, offered so small an obstacle to movement between different localities that upto the end of the 18th century there was no demand for prepared tracks. Transport was chiefly effected by pack animals, travelling along village pathways, while travellers could ride or be conveyed in palanquins. As regards the Indian armies, the whole system of military transport and supplies being necessarily adapted to a roadless country, the ordinary requirements under this head during peace differed in no material degree from the requirements of a time of war. This explains the extraordinary promptitude with which the wars of the Indian army had been so frequently entered upon.

The necessity, however, of maintaining a right of way and providing security to life and property on frequented routes was recognized. The Mughal emperors, in particular, concerned themselves to mark out and guard these. Among the routes most used by the caravans which carried traders and goods from one end of India to another were important tracks from Mirzapur to the South (known as the Great Deccan Road), from Agra to Ajmer, and from Allahabad to Jabalpur, which were kept open by the British until after the Great Revolt of 1857. There were also two or three established trade routes from Delhi: one passing through Mathura to Agra and thence *via* Etawah to Allahabad; another running *via* Garhmuktesar, Moradabad, Bareilly, Sandi and Rai Bareilly to Varanasi and on to Patna; a third following the alignment of the present Grand Trunk Road from Delhi to Aligarh.

The roads were generally guarded at intervals by posts (*chaukis*); between *chaukis*, the tracks were marked out by stones, pillars or avenues of trees. The zamindars through whose lands the roads ran provided watchmen (*chaukidars*) and were allowed to levy a small toll on the passing traffic. The *Amalguzars* or magistrates were responsible for all goods stolen within their jurisdiction. The security thus given was probably fairly efficient.

In the early period of British rule, the improvement of roads was undertaken chiefly with a view to facilitate postal communication; and until the various sections which afterwards formed the Grand Trunk

Road from Calcutta to Delhi were commenced, the idea of providing for wheeled traction was hardly entertained.

The backwardness of the state of affairs and the lack of proper organization was referred to by Sir John Shore in May 1833 as follows: 'As to roads, except for those within the limits of the civil stations, the 16 miles between Calcutta and Barrackpore is all that we have to boast of'. The main roads were at that time under Military Boards, one for each Presidency, without sufficient powers, either financial or administrative. In October 1839, the Military Board in Calcutta received orders to join up the various roads between Calcutta to Delhi, and to bring them into good order.

The conditions under which the provision and maintenance of roads were then carried out were chaotic. The actual work was effected through their own officers by the provincial authorities; and funds were supplied, sometimes directly by the Supreme Government, and partly by the zamindars and traders directly interested, sometimes by donations from the great nobles and rajas whose territories were traversed by the roads in question. A properly constituted department for carrying out civil public works was formed in the newly annexed Punjab by Captain Napier (afterwards Lord Napier). This was so successful that, in 1854-55, the Military Boards were abolished and the Public Works Departments were organized in all the provinces, under the general control of the Supreme Government exercised through its newly constituted Public Works Secretariat. After this reform, progress in road-making became much more methodical, and the upkeep more satisfactory than had previously been the case.

About the same time the construction of railways began to exercise considerable influence on the function and character of new roads. The extension of the railway system emphasized the need for roads built in a direction which would enable them to feed rather than compete with the newer means of communication; it also aroused greater demand for metalled roads. In 1823, according to Malony, 'the actual amount of local produce was in excess of local consumption', and 'for the prosperity of the country cheap and easy communication for the exportation of the produce was indispensable'. This remark sums up in brief the chief object with which roads were generally constructed in the first half of the 19th century. As the harvest season coincided with the drying up of the rivers, there was not much need for bridges except on the great trunk roads. On many of these, permanent bridges have not until recently been provided, ferried or floating bridges doing duty in their place. The majority of the early roads were merely embankments across low-lying places with easily graded approaches to river banks, and cleared and level surfaces elsewhere.

With the introduction of the railways, the conditions changed and there

arose a demand for bridged and metalled communications which would give access to the railway line at all times of the year. In some cases no doubt old routes were to a certain extent superseded by railways as a means of through communication; but on the whole, the influence of railways had been in the direction of stimulating progress in road construction and developing the traffic to be carried.

Another factor in stimulating the construction and upkeep of the roads was the extension of Local Self-Government. Just as the substitution of the provincial Public Works Departments for the old Military Boards, and the financial decentralization effected by Lord Mayo and Lord Lytton, enabled the Government to transfer most of the responsibility for road work to Local Governments, so the extension of Local Self-Government carried the process of decentralization a step further and enabled the Provincial Governments to delegate a large portion of their functions in this respect to District Boards. The extension of local control in each case was accompanied by considerable improvement to local communications. The agency to carry out the work was not the same in all provinces, as in Madras (Tamil Nadu) and Bengal where the District Boards employed independent staff, while elsewhere the road work sanctioned by the local Boards was generally carried out by the Public Works Department.

Most Indian roads used to be metalled with broken brick (*khoa*) or with nodular limestone (*kankar*) in the absence of stone and gravel not procurable over vast areas. The expense of maintenance, somewhat high, increased greatly by the effects of grinding wheels of carts. The cost of building roads varied from place to place according to the nature of the terrain. Costs were high in Bengal owing to the embankments, large amount of drainage to be crossed and inferior road metalling; in Bombay and parts of Madras the hilly character of the country increased the cost of construction. The expenditure on maintenance varied according to the funds available with local bodies and other agencies.

With the constitution of a suitable organization to look after the business of roads building and maintenance, a methodical classification of roads became necessary. The classification adopted lasted till 1943 and was as follows:

Class I metalled:

- (a) With bridges or ferries and drained throughout
- (b) Partially bridged and drained.

Class II unmetalled:

- (a) With bridges or ferries and drained throughout.
- (b) Partially bridged and drained.

Class III banked and surfaced, but not drained.

Class IV banked but not surfaced: partially bridged and drained.

Class V cleared and partially bridged and drained.

Class VI cleared only.

The road meterage in British India in 1901-1902 under regular maintenance was as follows: total length of metalled roads about 5,955 km., the upkeep of which being divided pretty equally between Government and local authorities; total length of unmetalled roads, about 218,872 km. about five-sevenths of which being maintained by local bodies. In addition to these were a number of roads repaired or reconstructed at irregular intervals, such as during famines, and certain others maintained by the Forest Department or by the owners of large private estates.

Roads and railways together have revolutionized the methods of transport, causing pack animals to be almost entirely displaced by wheeled vehicles throughout the greater part of the country. Tavernier referred to heavy wagons drawn by six pairs of oxen in the plateau and elevated tracks of Central and Southern India, but these had to be steadied with cords at the river banks and other bad places where too often they had to be unloaded. Light springless carts, drawn by a pair of oxen carried travellers 48 km. or 56 km. a day under most favourable circumstances. The commerce of the country, which used to be chiefly dependent on pack animals for transport and on enormous caravans traversing the Peninsula, carrying merchandise from one point to another, was to be taken over by railways, pack transport being limited to regions where railways had not come in, such as in sandy and hilly tracts. In several instances well built roads have been wholly or partly utilized for the purpose of light railways and tramways.

As roads came to be looked upon as a subject of local interest and importance only, the Government of India Act 1919 deemed roads to be purely a provincial subject and the Central Government ceased to be concerned with road development except for roads of strategic importance and for certain arterial roads, in the then existing princely States, such as the Bombay-Indore-Agra Road. The result was that little attention was paid to inter-State roads or roads required for developed areas.

**Indian Road Development Committee 1927:** The end of World War I saw the advent and development of motor transport in India and the need was felt for better roads capable of withstanding the centuries old bullock cart traffic and the new form of transport as the existing roads could ill resist the combined disintegrating action of such traffic. On a resolution passed by both chambers of the Indian Central Legislature in 1927, a committee was appointed to examine and report on the question of road development in India with M. R. Jayakar as Chairman. The committee observed in its report that "until recently, there had been a lack of system and continuity in road programmes" which had

to be corrected in view of the "demand for an extended range of movement and for a coherent system" which would make "the broken and disconnected lengths into a continuous whole".

The lack of bridges and crossings was a serious obstacle to traffic of all kinds and, apart from the inconvenience, waste of time and possible damage to bullocks, by seriously reducing even in the dry season the load the bullock cart could carry without difficulty, tended to diminish the economic value of the road as a whole. As for motor transport, regular services would not be satisfactorily established on an unbridged road. The deterioration of the road surfaces was being aggravated by the operation of motor transport. The condition of the subsidiary roads connecting villages also called for special consideration and relief.

The Committee concluded that the development of the road system was desirable, especially so because it would "make for the economic, social and political advancement of the rural population, on which the future of the nation so much depends." As road development was passing beyond the capacity of Provincial Governments and local bodies, and was becoming a national interest, the Committee recommended that it might to some extent be a proper charge on Central revenues. The most important recommendation affecting road development was that an additional duty of 2 annas per gallon (12.5 *paisa* per 4.5 litre) should be levied by the Centre on motor spirit for the specific purpose of road development and that the proceeds should be credited to a separate Road Development Fund. The Committee considered that the balances in the Fund should not be allowed to lapse at the end of each year as a road programme was required to be planned and executed for a number of years and for this purpose continuance of funds was to be assured.

This recommendation was accepted by the Government and the Central Road Fund came into existence on March 1, 1929. The additional petrol duty of 2 annas (12.5 *paisa*) was raised to 2½ annas per gallon (15.6 *paisa* per 4.5 litre) in 1931. The setting up of this Fund represents the first important step taken by the Central Government to promote road development in India.

The procedure for financing road development from the Central Road Fund required that 20 per cent of the annual revenue of the Fund should be retained as a Central Reserve in the Fund from which grants were given by the Government of India for meeting expenditure on the administration of the Fund, road experiments and research, and suitable road and bridge schemes in States (provinces), such as inter-State roads and bridges on the borders of States. The balance of 80 per cent was allocated to the various States on the basis of the actual petrol consumption in the respective States. A third division was instituted in the Fund in April 1950, called the Special Reserve, to which contributions

were to be made from outside the Central Road Fund proper for the financing of specified road projects.

With the commencement of the world-wide depression in 1930-31, the financial resources of the Central and Provincial Governments were adversely affected and funds for road development almost dried up. Indeed there was a time when the Road Fund became the main source of finance for road development. The deterioration of the roads became so serious that, even for normal maintenance needs in some instances, the balances in the Road Fund had to be drawn upon.

**Nagpur Plan:** In the meantime, the importance of a National Trunk Road system was coming to be recognized and discussions between the Provincial and Central Governments on making a start on a skeleton system led to the Government of India proposing a provision in the Constitution Act then under contemplation to permit national trunk roads being treated in some measure as a federal charge. Actually, however, because of the emphasis on provincial autonomy, no provision was made in the Government of India Act 1935, with reference to the Central interest in the development of arterial roads.

With the outbreak of World War II, the existing short-comings of the road system were brought home forcibly on the Governments. Intensive efforts were made to develop roads of military importance not merely in the operational areas but generally all over India, financed largely by substantial grants from the Defence Service Estimates. Defence requirements and the strategic importance of an efficient arterial road system during the emergency emphasized the need for this more than ever. It was also realized that the roads could be maintained satisfactorily only if the Centre took them over for development and maintenance.

In view of these considerations, the Government of India convened a Conference of Provincial and State Chief Engineers at Nagpur in December 1943, to consider the problem of post-war road development in India. The most important recommendations reached by the Conference were:

- (1) roads should be divided into four classes, namely, National Highways, Provincial or State Highways, District Roads and Village Roads; the National Highways, which were defined as highways running through the length and breadth of India connecting major ports, foreign highways, and capitals of provinces and of large States, being the framework of the country's road system;
- (2) the Centre should assume financial responsibility for the construction, development and maintenance of National Highways and have an effective say in the use and control of these highways;

- (3) there should be uniform "classification" standards throughout India; and
- (4) as lack of bridges was a handicap to through road communications, it was desirable to overcome this short-coming as early as possible, the Centre so phasing the bridge construction programmes that major bridges which lie on the boundaries between Provinces or States were not neglected.

The estimated road kilometrage to be reached during the succeeding twenty years was placed at 644,000.

After consultation with the Provincial Governments and discussions at meetings of the Transport Advisory Council, the Government of India accepted, with effect from April 1, 1947, complete financial liability for the development and maintenance of certain roads provisionally approved by them as suitable for inclusion in a system of National Highways. In the Constitution, the subject "Highways" declared by or under law made by Parliament to be National Highway is a Central subject (entry 23, list 1 in the seventh schedule). On April 15, 1957, the National Highways Act 1956 was brought into force. Under this Act, all highways in respect of which the Central Government accepted complete financial liability for development and maintenance as national highways were declared to be National Highways. The Act also empowers the Union Government to declare any other highway to be a National Highway or omit any highway from the list of highways to be declared as National Highways. Thirty-nine routes were declared under the Act as National Highways to be developed, constructed and maintained. The Constitution also conferred powers on the Government of India to give directions to a State as to the construction and maintenance of the means of communication declared to be of national or military importance. After the States' financial integration and the States' reorganization, road policy acquired a more uniform acceptance and application over the whole country than before.

Meanwhile, the Roads Wing of the Department of Transport was created as a result of the recommendation of the Nagpur Conference to provide a strong administrative and technical organization to administer the Road Fund and other funds approved by the Central Government for the development and maintenance of the National and State Highways and co-ordinate the road policies at the Centre and in the States. On the technical side, it functioned as a Central Designs Office besides acting as a repository of technical information on roads and bridges. From 1950 onwards, the Roads Wing also had the overall responsibility for the development and maintenance of certain selected roads, namely, those in the Centrally-administered areas (Union Territories), roads under the charge of the Central Public Works Department (C.P.W.D.) in Sikkim and the roads in the North-East Frontier

Agency: the West Coast Roads in Tamil Nadu and Maharashtra States, the Passi-Bodarpur Road in Assam and the Dhar-Udhampur Road in Jammu and Kashmir State. The head of the Roads Wing is the Consulting Engineer (Road Development) who is also ex-officio Joint Secretary to the Government of India.

During the period 1951-1968 the increase in the surfaced and unsurfaced kilometrage of roads has been substantial, which may be seen from the Table below:

TABLE X  
Length of Roads in India by Surface, 1951-1968, Select Years  
(In thousand kilometres)

|                             | As on March 31 |      |      |      |      |      |
|-----------------------------|----------------|------|------|------|------|------|
|                             | 1951           | 1956 | 1961 | 1966 | 1967 | 1968 |
| 1. P.W.Ds. and Local Bodies |                |      |      |      |      |      |
| Black top                   | 21             | 55   | 98   | 151  | 158  | 166  |
| Cement concrete             | 2              | 4    | 5    | 6    | 5    | 6    |
| Water bound Macadam         | 135            | 124  | 132  | 126  | 137  | 144  |
| Total surfaced              | 157            | 183  | 236  | 283  | 301  | 316  |
| Unsurfaced, motorable       | 243            | 256  | 269  | 271  | 276  | 286  |
| Total                       | 400            | 439  | 505  | 555  | 577  | 602  |
| II. Kutch, unsurfaced*      | —              | 60   | 204  | 280  | 307  | 323  |
| Total unsurfaced            | 243            | 315  | 473  | 551  | 583  | 609  |
| Grand total                 | 400            | 498  | 709  | 835  | 884  | 925  |

\*Constructed in C.D. and N.E.S. Blocks.

The rapid increase in the kilometres of roads since 1951 has been made possible largely by the outlays on development, improvement and new construction under the three Five Year Plans. The total length of roads on March 31, 1968 in the different States is shown in the Table below:

TABLE XI  
Length of Roads in India by States as on March 31, 1968  
(Figures in kilometres)

| State/Union Territory      | Surfaced roads | Unsurfaced roads | Total   |
|----------------------------|----------------|------------------|---------|
| Andhra Pradesh             | 33,375         | 54,973           | 88,348  |
| Assam                      | 5,190          | 36,736           | 41,926  |
| Bihar                      | 13,525         | 43,295           | 56,820  |
| Gujarat                    | 15,063         | 23,233           | 38,286  |
| Jammu and Kashmir          | 3,558          | 15,625           | 19,183  |
| Kerala                     | 19,480         | 36,355           | 55,835  |
| Madhya Pradesh             | 26,684         | 38,308           | 65,002  |
| Maharashtra                | 31,217         | 25,328           | 56,545  |
| Karnataka                  | 36,663         | 27,131           | 63,794  |
| Nagaland                   | 273            | 4,166            | 4,439   |
| Orissa                     | 9,190          | 43,941           | 53,131  |
| Punjab (including Haryana) | 12,964         | 46,759           | 59,723  |
| Rajasthan                  | 18,107         | 29,909           | 48,016  |
| Tamil Nadu                 | 41,776         | 21,182           | 62,958  |
| Uttar Pradesh              | 26,976         | 98,545           | 125,521 |
| West Bengal                | 15,150         | 37,990           | 53,140  |
| Union Territories*         | 5,795          | 26,668           | 32,463  |
| Total                      | 315,996        | 669,134          | 925,130 |

\*Includes 62 km. of National Highway length in Sikkim.

**Border Roads:** The Border Roads Development Board was formed in 1960 to accelerate the economic development of the North and North-Eastern Border areas. Construction of more than 7,300 km. of new roads and the improvement of about 4,970 km. of existing roads have been included in the immediate programme of the Board.

By the end of 1960-61, the Nagpur Plan targets had been realized, taking the country as a whole despite shortfalls in individual States and regions. The Chief Engineers from the Centre and the States met together some four years earlier and formulated a new twenty-year Road Development Plan for 1961-81 which was presented to the Department of Transport, Union Ministry of Transport. The bases assumed for the Plan were that in developing agricultural areas, no village should remain more than 6.44 km. from a metalled road or more than 2.4 km. from any type of road. In working out specific proposals such economic factors as area, population, regional levels of development and development needs and possibilities were to be taken into consideration. This Road Plan would provide the country with 32 km. of road per 100 sq. km. of area by 1981, as compared with half the ratio of this length of road at the end of the Second Plan. The cost estimated was Rs. 5,200 crores, of which Rs. 630 crores were to be on village roads.

There can be no doubt that, with the clearer appreciation of local needs as a result of economic planning and better estimation of the demands of new industries and increased agricultural production, plans for road improvement and construction have received more detailed and critical appraisal as part of the overall programme of road development. Special attention is also being paid to the roads for development projects in rural areas as well as backward and hilly regions. More recently, the complex problems of metropolitan areas have also been studied from the point of view of passenger and goods transport and of removal of obstructions to traffic movement such as level crossings.

The progress of expenditure on roads during the successive Plan periods may be seen from the following figures:

|                        | <i>Expenditure (Rs. Crores)</i> |
|------------------------|---------------------------------|
| First Plan             | 134.47                          |
| Second Plan            | 245.80                          |
| Third Plan             | 459.00                          |
| Annual Plans (1966-69) | 307.00                          |
| Fourth Plan            | 876.00                          |

In June 1961, the International Development Association, an affiliate of the World Bank, extended a Development Credit of \$60 million (Rs. 28.57 crores) to meet about 55 per cent of the cost of certain selected road and bridge works on National Highways in the States of Bihar, West Bengal, Orissa and Maharashtra as well as on the Eastern Express Highway in Bombay City. The loan is interest-free and repayable over a period of 50 years.

The road kilometrage during the successive Plan periods is summarized below:

TABLE XII  
Road Kilometrage at the end of Each Plan

|                  | <i>Surfaced</i> | <i>Unsurfaced</i> | <i>Total</i> |
|------------------|-----------------|-------------------|--------------|
| 1951             | 157,019         | 242,923           | 399,942      |
| First Plan       | 183,023         | 315,321           | 498,344      |
| Second Plan      | 235,790         | 473,330           | 709,120      |
| Third Plan       | 283,385         | 551,380           | 834,765      |
| Annual Plan 1968 | 315,996         | 609,134           | 925,130      |

The Fourth Plan, under both the Central and State sectors, places special emphasis in the road development programmes on the removal of deficiencies, such as missing links and unbridged river crossings on metropolitan roads, and on the development of rural roads.

**Road Transport:** Road transport as an important factor of large scale transportation in the country developed only with the advent of the motor vehicle. Other forms of road transport, such as bullock carts, horse-drawn carriages, *palkies*, etc., had only a limited range of operation in regard to both the area covered and the number of persons and volume of goods carried. The new form of transport came into increased use for public transport only in the second decade of the present century, and with it surface transport in India entered a new phase.

Prior to 1914, the operation of motor vehicles in the provinces of Madras, Bombay, Bengal, the United Provinces and the Punjab, was regulated by their respective provincial acts. It was only in 1914 that the first All India enactment relating to motor vehicles — Indian Motor Vehicles Act 1914 — was passed. The Act, however, did not make any distinction between different types of motor vehicles. Nor was any attempt made to restrict their free movement.

Conditions radically changed after World War I, 1914-18, when the surplus military vehicles were put on the roads in large numbers. The pace at which goods and passengers came to be transported by road took even the Provincial Governments by surprise. Fare cutting and poorly maintained vehicles created serious problems of competition and safety on roads. The Act of 1914 had to be supplemented in the post-war years by provincial legislation in an effort to introduce some form of regulation and control. The remarkable ease with which motor vehicles reached parts of the country which had seldom seen even bullock carts from outside except at infrequent intervals of fairs, festivals or market days, helped to accelerate the pace of the change. Within a decade the ubiquity of the motor vehicle had transformed the scene.

The increasing diversion of traffic to the road and the consequent financial losses to the railways, particularly against the background of

steeply declining revenues with the onset of the world-wide depression, drew attention to the importance and urgency of developing a sound policy on the question of regulating road-rail competition. The problems to be dealt with related to the diversion of railway III class passengers to the bus, the long-distance passengers to the private automobile and the goods traffic to the lorries. It was not all a question of more diversion of traffic: motor transport did indeed develop a considerable amount of new traffic in areas not served by the railways or where the facilities provided by the railways were less attractive from the point of view of frequency of service, convenience and/or cost. Road conferences with representatives of the Central and Provincial Governments and other interests affected, held at irregular intervals since 1929, did not lead to any improvement in the situation. The Indian Railway Enquiry Committee 1937, discussing the question of road-rail competition, made a large number of recommendations in regard to general policy, legislation and detailed measures to be taken in regard thereto. As a result of these, the Transport Advisory Council was set up as a policy-making body at the Centre, with the Central Minister (then called Member) dealing with motor transport as Chairman and the State Ministers of Transport as Members.

The Government of India Act 1935 made provision for Central legislation by including "mechanically propelled vehicles" in the concurrent list. Uniformity in dealing with motor vehicles was sought to be achieved by passing the Motor Vehicles Act of 1939 in accordance with which rules were framed thereunder by the State (Provincial) Governments. Modelled on the English Acts, the Act provided for the creation of Regional and Provincial Transport Authorities with full powers to grant permits to "stage carriages" (buses), "public carriers" (public goods vehicle owners), and "private carriers" (owners of goods vehicles carrying their own goods), etc., and to lay down conditions (routes, timings, specifications of vehicles, standards of maintenance, etc.) under which the permit holders must operate. An important provision gave independent powers for all practical purposes to Provincial and Regional Transport Authorities who were not subject to the direction of the State Governments in regard to their decisions on the issue of permit. Under the Act, State Governments were empowered to prohibit or restrict conditionally, by notification in the State Gazette, the conveying of long distance goods traffic by road or of specific classes of goods by private or public carriers with the object of promoting co-ordination of road and rail transport. The regulatory restrictions under the Motor Vehicles Act were later to be embodied in the "Code of Principles and Practices in the Regulation of Motor Transport," and circulated to State Governments for adoption in 1950.

Motor transportation suffered a setback during World War II. The

private operators were faced with numerous difficulties, such as stoppage practically of the imports of spare parts as a result of which their prices rose to abnormal levels and the restrictions imposed on the amount of petrol that could be consumed. The available trucks were practically requisitioned by Government and they were driven by producer-gas to the maximum extent possible.

The proper index of progress of motor transportation is the number of motor vehicles operating in the country from year to year. Unfortunately, there is no information prior to 1925 and, in respect of the number of vehicles operating in later years upto 1947, the statistics available for the country do not include the former princely States. The figures relating to imports however, are available and apply possibly to the whole country (Table XIII).

TABLE XIII

No. of Motor Vehicles Imported Each Year and the Total Number of Motor Vehicles  
1913-1947, Select Years

| <i>March 31</i> | <i>Import of Motor Vehicles</i> | <i>No. of Motor Vehicles</i> |
|-----------------|---------------------------------|------------------------------|
| 1913            | 3,089                           | —                            |
| 1915            | 3,356                           | —                            |
| 1920            | 13,486                          | —                            |
| 1925            | 12,998                          | 48,797                       |
| 1930            | 34,661                          | 117,900                      |
| 1935            | 25,201                          | 127,878                      |
| 1940            | 25,528                          | 136,985                      |
| 1945            | 7,811                           | 142,172                      |
| 1947            | 22,407                          | 168,368                      |

**Policy for Road Transport:** In September 1954 the Planning Commission, in consultation with the Ministry of Transport, issued a communication to State Governments with reference to the basic policy for the development of road transport under the Five Year Plan. Where Government participation was contemplated it was stated that the setting up of a tripartite organization with the State Governments, railways and private operators should be promoted. In formulating the Second Five Year Plan, the Planning Commission approved of the schemes of various State Governments for the expansion of road transport services on the strict understanding that they would set up Road Transport Corporations under the Road Transport Corporations Act 1950. Some of the State Governments, like Kerala and Uttar Pradesh, desired to continue the operation of nationalized transport services departmentally on the ground that they would otherwise lose a substantial amount of revenue. The corporations would have to pay income-tax and incur more expenditure on amenities and road development from the balance of profits. The Planning Commission did not agree and, in December 1957, the State Governments were informed by the Ministry of Finance (Department of Economic Affairs) that,

with effect from April 1, 1958, assistance from the Centre, whether by way of loans or grants, would not be available to transport undertakings owned and/or managed departmentally unless they were incorporated under one or the other of the special enactments or as a company under the Indian Companies' Act. In spite of these instructions, some State Governments did not agree to constitute Road Transport Corporations or joint stock companies to take over management of the departmentally operated road transport services. As the National Development Council did not reach any final decision, it was referred to the Committee on Transport Policy and Co-ordination, which unanimously supported the policy of forming statutory road transport corporations with the participation of the railways and the undertakings to ensure a degree of co-ordination of rail and road transport. The Planning Commission, therefore, decided to adhere to this policy.

The Transport Development Council (set up in 1958) advises the Government on all matters relating to roads, road transport, inland water transport and internal air transport, and on such problems relating to co-ordination between different forms of transport as may be referred to it. The Road and Inland Water Transport Advisory Committee, with the Minister of Shipping as Chairman, was set up in 1958 to discuss problems relating to roads, road transport and inland water transport, and make recommendations to the Transport Development Council for final decision.

**Inter-State Transport Commission:** With the rapid extension of motor transportation from one State to another, the need was felt for an Inter-State Transport Commission to deal with matters affecting inter-State road transport. Legislation to this effect was completed in December 1956 in the Motor Vehicles (Amendment) Act 1956, by which an Inter-State Transport Commission was constituted "for the purpose of developing, co-ordinating and regulating the operation of transport vehicles in respect of any area or route common to two or more States". The functions which the Commission may be authorized to do under the Act are:

- (a) to prepare schemes for the development, co-ordination or regulation of the operation of transport vehicles, and in particular goods vehicles in an inter-state region;
- (b) to settle all disputes and decide all matters on which differences of opinion arise in connection therewith; and for the regulation of the operation of transport vehicle in an inter-State region;
- (c) to issue directives to State/Regional Transport Authorities interested, regarding the grant, revocation and suspension of permits, or countersign permits for operation in any route or area common to two or more States;

- (d) to grant, revoke or suspend any permit or countersign permits for operation of any transport vehicle in respect of such route or area common to two or more States as may be specified by the Central Government;
- (e) to perform such other functions as may be prescribed by the Central Government under Section 63-C of the Act.

Since its establishment in 1958, the Inter-State Transport Commission has brought about a number of reciprocal agreements between all contiguous States for the regulation of inter-State traffic, including some long distance inter-State routes, covering more than two States. Among the several steps taken to improve inter-State transport may be mentioned the issue of composite permits under the South Zone, affording an option to permit holders to choose any four States other than the home State for the purpose of operation. The Commission has been making efforts to improve missing links and remove bottlenecks to facilitate smooth flow of long distance traffic.

The Central Road Transport Corporation was set up for maintaining essential supplies in the North-Eastern region following the Chinese aggression.

**Progress under Plans:** The progress of road transport under the stimulus of planned programme of development has indeed been striking. From the statistics relating to it since 1950-51, it will be seen that the number of motor vehicles registered in India had more than doubled by 1960-61, and increased to 470 per cent by 1968-69. A large proportion of the increase, however, was under motor-cycles and auto-rickshaws (Table XIV).

TABLE XIV  
No. of Motor Vehicles Registered In India

|                                 | 1950-51 | 1960-61 | 1968-69*    |
|---------------------------------|---------|---------|-------------|
| Passenger cars and jeeps        | 147,712 | 287,913 | 512,037     |
| Taxis                           | 11,551  | 21,663  | 44,804      |
| Buses                           | 34,411  | 56,792  | 85,490      |

#### IV. Inland Water Transport

As in other countries naturally endowed with navigable river systems, water transport has been an important adjunct of India's economy from time immemorial. It was more economical, and with the long coastline of over 4,800 km. and main rivers flowing down hundreds of kilometres all the year round, these waterways provided the means of conducting trade with the neighbouring countries from earliest times.

In 1829, H. T. Prinsep, Secretary to the East India Company, referred to the state of inland navigation in these terms: "There is no river in the world, unless those of China be exceptions, on which there is so large a navigation as on the Ganges and its tributary streams. Major Rennell, writing in 1780, reckoned that no less than 30,000 boatmen found their livelihood from this source, and as that was a time when trade was far less flourishing than at present . . it might not be too much perhaps to assume the number of boatmen in the present day to be double that estimate . . Everybody that has lived on the banks of the great Ganges has been struck by the constant succession of boats moving up or down, the river never appearing for a minute altogether clear and as this is nearly the same at all seasons and in all places, it leaves an impression of the extent to which this magnificent stream ministers to the wants of commerce and of the traveller, such as defies the attempt at computation. It is not Ganges only as a single stream that confers these benefits but all the larger rivers that bring down the water of the Northern hills are navigable more or less throughout the year and almost to the foot of the first range."

Although the main river systems of the country, principally Ganga, Brahmaputra, Indus, Bhagirathi, Hooghly, Mahanadi, Godavari, Krishna, Kaveri, Narmada and Tapti, had figured prominently as carriers of goods and passengers for centuries past, water transport thrives today only in the States of West Bengal, Assam, Andhra Pradesh and Kerala and, to a limited extent, in the other States. During the 19th century, the canals and waterways provided some of the main arteries of the transport system of the country. The introduction of steam vessels in north-east India during the early part of the last century completely revolutionized inland water transport. This assisted the growth and development of the indigo industry in Bihar, the jute industry in Bengal and the tea industry in Assam, Sylhet and Cachar valleys. Inland water transport facilitated the movement of the produce of these areas to Calcutta for export by sea to the world markets.

The importance of waterways was stressed by Sir Arthur Cotton, the pioneer of irrigation works and canals in India. According to him, "Water is incomparably India's greatest treasure and, were this generally turned to account, she would be in the highest state of temporal prosperity." In the Master Plan for Navigation, he proposed a network

of navigable canals and rivers for the entire country, a greater part of which could have been executed at the time as the withdrawals for irrigation were low and would have succeeded in attracting industries to the close proximity of waterways. The reluctance of the Government, apprehending the effects of competition of navigable canals on the vast system of the railways along the main lines of communication and possible inroads into the profits of the railway companies which they had guaranteed or were deriving on the State lines, stood in the way of an active policy of development of inland water transport. Some of the irrigation canals, such as the Ganga and the Yamuna canals, also proved inadequate to serve at the same time the interests of irrigation and navigation. The withdrawals of water from the Ganga resulted in the rapid decline of navigation in the upper reaches in the dry season.

With the active encouragement given to the railways at the cost of water transport, important towns, trading centres and industries developed along areas in close proximity to the railway lines, and the loading and unloading stations along the canals and other waterways, ceased to attract trade and declined rapidly in importance. The end of the last century saw that, while the railways prospered, the less organized water transport was steadily driven out of business, except in regions such as north-east India where, by virtue of the natural advantages of a network of waterways and the difficulty of bridging mighty rivers like the Ganga and the Brahmaputra and numerous deltaic off-shoots in the Sunderbans, steamer companies organized on sound commercial lines continued to flourish. The other regions where inland water transport operated successfully were on the Krishna and the Godavari, where similar advantages stood them in good stead. The backwaters of the west coast also supported an active water transport system.

The total length of navigable waterways in the different parts of the country in 1890-91 was 2,882.5 miles (4,737 km.), as may be seen from the Table below:

| TABLE XVII                                                      |              |       |
|-----------------------------------------------------------------|--------------|-------|

|                         | <hr/> 1275½ |          |
| Total: All India        | 2,882½      | (16,026) |

Both inland navigation and irrigation depend for their fullest development on the construction of canals. The construction of a canal for transport would be justified only if there were a certainty that it would be extensively used for navigation and on the new line of communication a material saving would be effected in the cost of transport. Apart, however, from all questions of cost, the exigencies of irrigation and navigation are not always compatible. Traffic is not attracted to a navigable canal which does not pass through large cities or important trade centres, or which is not in uninterrupted connection either with the seaboard or with the waterways which form the most convenient outlet for the produce of the tract which the canal traverses. It happens, therefore, that irrigation canals are not always suitable for navigation and, on the other hand, many canals constructed for purposes of navigation only do not irrigate a single hectare.

**Inland Waterways in North-East India:** Of the various waterways in India, the rivers of the north-east India have, by virtue of the largest meterage and volume of tonnage carried, constitute the most important inland water transport system. The rivers concerned are the Brahmaputra and the Ganga with their tributaries forming about 6,400 km. of waterways through a network of delta rivers and creeks in the Sunderbans. These rivers which impede the operation and development of overland transport are thus a great natural gift to north-east India, as they provide the main channels over which the bulk of the produce of the region is transported.

Assam has a vast internal waterways system. The Brahmaputra, the main artery, flows down the centre of the Assam valley, over a length of 724 km. A number of tributaries, mainly the Subansiri, the Dehing, the Burhi Dehing and the Dehand, are also navigable for varying distances from their mouths. There is a considerable variation in the levels of the main river between the monsoon and dry seasons.

amounting to about 9 metres and current velocities average 8.5 to 9.7 km. per hour during monsoon and 4 to 6 km. per hour in the remaining season. The State is almost entirely dependent on water transport during the monsoon season when the road and rail communications are seriously disrupted. Navigation during this period has its hazards, because of the large volume of silt carried, debris, snags, etc. which are, however, contended with by the operators who have considerable experience of the region. These conditions have influenced the choice of paddle in preference to screw propulsion.

Regular steam services used to operate upto Dibrugarh throughout the year at draft of 1.6 metres. After the earthquake of 1950 which caused the deterioration of the river channels in the upper reaches, the mainline services terminated at Deshangmukh, 76 km. downstream of Dibrugarh, with a feeder service at a draft of 1.21 metres (4'0") connecting upto Dibrugarh. The protection works at Dibrugarh having induced siltation along the town bank, leaving no suitable berthing sites, even down to 1.93 km. at Bogi Bheel, the feeder services have had to be withdrawn since 1956. The main products of Assam are oil, jute, timber products and tea. About 90 per cent of Assam's tea crop and jute used to be transported to Calcutta by river transport. Despite the little higher rates for carriage by water of tea from Assam tea gardens to Calcutta, as compared with the rail, water transport was preferred because of the advantage of transit time, about 7 days by river against 15 to 20 days by rail. Furthermore, the tea transit sheds and other warehousing establishments at Calcutta have been set up for operation in conjunction with water transport.

Shoals at certain places cause difficulties to navigation. During April 8 to 20, 1958, 70 vessels with nearly 30,481 tonnes of cargo were held up. According to the Joint Steamer Companies, a loss of 12 per cent of annual capacity or of 91,444 tonnes of traffic were lost because of the Noonkhowa Shoal. Better co-ordination among the operators and river training measures have effected great improvement.

The rivers of the Suema Valley have been deteriorating progressively for some years, caused by the rapid run off during the monsoon season and diminished conservation of water supply due to the excessive deforestation of the surrounding Cachar Hills and increased grazing in the lower catchment areas. The low level during the dry season and the shoals between Silchar and Karimganj have restricted feeder services. Lack of terminal facilities and proper approach road connections to the Ghats have been other difficulties experienced by water transport.

The river navigation was mostly in the hands of the Joint Steamer Companies comprising the Indian General Navigation and Railway Company Ltd. and the River Steam Navigation Company Ltd., both incorporated in England with sterling capital. The assets and liabilities

of the Indian branch of the Indian General Steam Navigation Company were taken over by the River Steam Navigation Company. As their craft became uneconomical, Government of India entered into an agreement for the rehabilitation of these crafts by grant of loans amounting to Rs. 2 crores. There were also, besides these, ten Indian companies registered at Calcutta for river navigation.

The Joint Steamer Companies maintained a system of through booking with the railways for many years *via* certain junctions, namely, Shalimar "C" Shed, Dhubri, Pandu, Amingaon, Tezpur, Silghat, Neamati, Karimganj, Manihari Ghat, Paleza and Dibrugarh (temporarily closed). The Indian companies operated between West Bengal, East Bengal (Bangla Desh) and Assam. They do not operate any service on the Ganga and its feeder rivers. The entire fleet of all these companies combined was but a small fraction of the fleet owned by the two English companies, and carried about 10 per cent of the total cargo moved in this region. Their difficulties were old and obsolete craft and inadequate financial resources.

**Ganga Water Transport Board:** At the instance of the Inland Water Transport Conference 1951, the Ganga Water Transport Board was constituted on March 8, 1952. With representatives from the participating States and functioning under the Ministry of Transport, the efforts of the Board were directed to improving facilities, equipment and transportation in the waterways under its control.

The Ganga, with its important tributaries, the Gomati, Ghagra, Gandak, Burhi Gandak and Kosi in the north and the Yamuna, Sone, and Damodar in the south, is the most important waterways system in the States of Uttar Pradesh, Bihar and West Bengal. Emerging as a fair-sized river from Hardwar, the Ganga gets depleted by the Upper and Lower Ganga canals, but augmented by the waters of the Ramganga and the Yamuna at Allahabad, the Ghagra, Sone and Gandak near Patna. From here the river flows in a solid stream, receiving in its course the waters of the Kosi before it turns south past the Rajmahal Hills and towards the east joining the Brahmaputra at Goalando and later spilling into various distributory streams before falling into the sea. The Ganga *via* the Hooghly and the Bhagirathi has a total length of about 2,600 km.

The Ganga and its tributaries had long formed the main trade routes and carried a considerable volume of traffic. Steamers from Calcutta used to ply upto Garhmuktesar, about 644 km. above Allahabad. Till about fifty years ago, steamers used to proceed to Allahabad from Calcutta. Country boats plied above this point with a great bulk of cargo. On the Yamuna large quantities of cotton grown in Bundelkhand used to be sent down from Kalpi.

With the coming of the railways and of industries along their routes and the more recent development of roads and road transport, navigation on the Ganga and the canals dwindled greatly in importance. Navigation on the Yamuna is at present confined to a stretch of about 64 km. above its confluence at Allahabad. The snow-fed Ghagra has adequate discharge during the dry season and has considerable navigation potential. Till the time of the partition of India, a daily service used to operate upto Burhej. The steamer services run by the Joint Steamer Companies from Patna to Burhej were terminated on January 1, 1958. Country boats, however, operate for regular trade as far as Kartanian Ghat near Nepal border. The Sone is navigable for big country boats only during monsoon upto Dehri-on-Sone. On the Gandak, there is considerable boat traffic upto Tribeni Ghat on the Indo-Nepal border. Despite its vagaries, the Kosi is navigable by big country boats from its confluence with the Ganga upto Hanumannagar, a distance of about 670 km. and by smaller boats to a further 56 km. upto Chapra in Nepal from which large quantities of stone are transported down the river for the Kosi barrage.

The Upper Ganga canal, built as an irrigation-cum-navigation canal, was navigable throughout its length of 343 km. till 1933-34, after which navigability decreased to only about 6 km. from the off-take because of power houses blocking the canal. The Lower Ganga canal, also designed for navigation throughout, now permits boats to ply between the headworks and 56 km. and from km. 112 to km. 209.

On the Sone canal system, country boats ply all the year round on the Main Western canal and for a short length of about 7 km. only on the Eastern canal. Country boats ply over 127 km. on the Patna canal and small steamers over 100 km. of this canal. The Arrah and Buxar canals are throughout navigable for country boats and for some 85 km. on the former for small steamers.

The Ganga is navigable from Patna downstream throughout the year. The prospects of the river and canal system in Uttar Pradesh and Bihar have been adversely affected by withdrawals of water for irrigation, the development of railways on both banks of the river and the recent development of mechanized road transport. The lack of location of major industries on the banks of the river has affected the scope for water transport. The partition of the country has also affected the activities previously carried on by water transport in the Ganga network. The movement of traffic between Calcutta and Upper India used to be triangular, namely, Bihar to Assam *via* East Bengal (Bangla Desh), Assam to Calcutta and Calcutta to Bihar; the inland water transport operators maintained water transport through the Ganga, making Goalando the transshipment point for craft plying on the Ganga and

the Brahmaputra. With the partition of the country and the decline of trade with the then East Pakistan (Bangla Desh), the steamer companies completely closed their services on the Ganga.

During 1948-53, the navigation potential of the river Ganga, particularly between Mokameh and Kanpur, a distance of 885 km. was examined by the Central Water and Power Commission. Otto Popper and J. J. Surie, United Nations experts, who undertook a study of the problem of inland navigation in this region, recommended the starting of a pilot project consisting of shallow draft tugs and barges in the reach between Buxar and Allahabad, a distance of 373 km. and the conducting of towing trials of the country boats by power craft. The Ganga Brahmaputra Water Transport Board, which had been appointed in 1952, started on towing trials by tugs around Patna. The programme of starting a pilot project above Buxar, however, received a setback owing to the sudden closure of the steamer services on the Ganga River system by the Joint Steamer Companies, the only concern which had been running steamer services on the Ganga for about 100 years. The Board was merged with the Inland Water Transport Directorate in March 1967.

**The Hooghly:** The river Hooghly, formed by the confluence of the two Nadia rivers, spill channels of the Ganga about 129 km. above the port of Calcutta is one of the most important waterways in the country. The port itself, situated on the left bank of the Hooghly, is the principal outlet for such products of the country as coal, jute, tea and ores, as well as the products of the States of Uttar Pradesh, Bihar, Orissa, Assam and West Bengal. More than one-tenth of the large volume of traffic handled at the port is carried by inland water transport. Owing to inadequate upland water supply, the conservancy and maintenance of the approaches to the port has presented serious problems. The urgent need for ensuring perennial head water supply which will be necessary to cope with further increase in traffic generated by the development of steel mills and engineering industries has led to the construction of the Farakka Barrage, on the completion of which the navigability of the river is expected to improve considerably.

**The Sunderbans:** The Sunderbans, representing the intersection of numerous streams and large rivers, has provided navigable cross channels connecting the estuaries of the rivers. Inland water transport is the sole means of communications in this area. The Do-Agra-Khal creek running east to west connecting with the Saptamukhi provides the only link for Calcutta with Assam and Upper India.

**Older Canals Connecting Calcutta:** The remaining waterways have

declined in importance. The Roopnarayan river with its outfall into the Hooghly at Geonkhali has now a ferry service only up the river for a few miles. The Circular and Eastern canals taking from the Chitpur Lock on the Hooghly and extending upto Hansabad and the Yamuna river provided, prior to the partition, a convenient and safe navigation route for country boats plying between East Bengal and Calcutta, as it avoided the dangerous outer passage through the Sunderbans. The Tolly's Nallah, which once extended to 28 km. from the Kidderpur Docks, has, in consequence of the silting up of the Bidyadhari, navigation facilities only for a short distance in the urban and rural areas. The Midnapur canal, 116 km. in length constructed towards the end of the last century, was of considerable economic importance at the time. The extension of the railway, the resultant competition and the diversion of traffic brought about a rapid decline of the canal, and parts of the canal, between the Roopnarayan and the Damodar, were closed. The traffic between Damodar and Uluberia on the Hooghly is stated to have dropped from 39,626 tonnes to 9,144 tonnes between 1952-53 and 1955-56. The Hijli Tidal canal (also called the Orissa Coast canal) from Geonkhali on the Hooghly upto the Rasul river and the Orissa Coast canal further south has a total length of 89 km. in West Bengal. Although the railway has spelt ruin in this case as in some others, the Hijli Tidal canal appears to be active.

**The Damodar Canal:** The Damodar-Tribeni canal, part of the Damodar Valley Corporation's project, 137 km. long, is intended to be an irrigation-cum-navigation canal, navigation being in the tail portion. The canal is expected to enable crafts and barges upto 1.83 metres draft to ply throughout the year. The canal is expected to attract trade and industry on both banks. The traffic planned is about 2 million tonnes, made up largely of coal from the Raniganj and Ondel coal-fields.

**The Mahanadi and Orissa Canals:** The Mahanadi river system and canals provide the State of Orissa with important facilities of inland water transport, particularly in a region having sparse rail communications and inadequate road facilities. The river has a length of about 480 km. in the State and navigation is active on it throughout the year.

Below Cuttack is the Delta canal system. The Kendrapara, the Taldanda and the High Level canals connect the Paradip port with Cuttack; they also supply water for irrigation purposes. The Kendrapara takes off from the pool upstream of Birupa anicut and has its outfall into the Jumbo river, connecting Cuttack with Paradip and False Point. The Taldanda canal on the right bank of the Mahanadi takes off near Cuttack and has its outfall on the Mahanadi about 14.5 km. from Paradip port. It has got narrowed in the lower reaches where

the depths are considerably reduced. The High Level Canal Range I runs from its offtake off Birupa river to its outfall into the Brahmani at Jenapur, a distance of 53 km.

Before railways came to Orissa, the Kendrapara canal was the principal artery of communication, bi-weekly steamer services operating from Cuttack to Chandbali port through the Gobri canal and the Brahmani and Baitarani rivers. These services were connected to regular services to Calcutta through the Matai Nallah and the Orissa Coast canal. The development of the railways proved fatal to water transportation and the Orissa Coast canal itself was abandoned in 1928.

Waterways provide the chief mode of transport in the deltaic districts of Cuttack, Balasore and Puri. The network of navigable waterways and connecting cross channels in this area is comparable to the Sunderbans.

The Mahanadi plays an important part in bringing the rich forest and mineral resources in the upper reaches of the river. When the minimum regulated discharge of water from the Hirakud becomes available, the navigable potentialities in the middle and upper reaches are expected to improve.

The Government of Orissa has been taking steps to rehabilitate, improve and develop the waterways and these have acquired a special significance in connection with the traffic to be handled by the Paradip port. These canals and the Mahanadi may acquire greater importance when the major port of Paradip begins to handle the full traffic potential of its hinterland.

**The Godavari and Krishna River Systems:** The navigable waterways of the Godavari comprise the main river with the tributary Sabari, the delta arms of the Gautami, Vasistha and Vynatheyam and a network of irrigation-cum-navigation canals in the delta. The Godavari, the second largest river in the Union, with a total length of about 1,500 km., descends through the Western Ghats from near Nasik and flows in a south-easterly direction, falling into the Bay of Bengal in the form of a delta below Rajahmundry. From anicut at Dowlaiswaram, below Rajahmundry, a network of irrigation-cum-navigation canals takes out on either bank.

The Godavari is navigable by country boats of upto 40 tonnes to a distance of about 300 km. and by small steamers upto Bhadrachalam, a distance of 161 km. upstream from Dowlaiswaram, throughout the year. The delta canal system extending to about 790 km. comprises (1) the Godavari Eastern Delta canals to the north of the Gautami, (2) the Godavari Central Delta canals between the Gautami and the Vasistha, and (3) the Godavari Western Delta canals to the south of Vasistha. The activities connected with tapping the rich mineral and forest pro-

duce of the regions traversed by the river have given special importance to the extension of navigation facilities of the Godavari network.

The Krishna, rising in Mahabaleshwar, traverses through a hilly region in a south-easterly direction till it falls in the Bay of Bengal, below Vijayawada. The Krishna River system comprises, besides the river, the delta canal system, Kurnool-Cuddappah canal and the Tungabhadra canal in Karnataka. There is a weir across the river at Vijayawada from which irrigation-cum-navigation canals have been taken out. The canal system has a total length of 644 km. The river is navigable by country boats and small steamers (upto 30 tonnes capacity) in the tidal reach for about 66 km. to a point 37 km. below Vijayawada anicut, whence navigation is routed through the delta canals connected above the weir by suitable locks. From the anicut upstream country boats and small steamers ply for about 37 km. throughout the year, and during the monsoon for a further 64 km.

The Krishna Delta canals form the connecting link between the Godavari canals in the north and the Buckingham canal in the south. Through communication is therefore possible between these canal systems, thus providing a continuous waterway over a distance of about 730 km. from Kakinada in the north to the Mercanum (Marakkanum) backwaters in the south. Several industrial concerns, which have sprung up close to the Krishna Delta canal system, can, it is stated, utilize water transport for bulk movement of commodities when improvement has been effected in the facilities.

The Tungabhadra canal, 227 km. in length, takes off from the Tungabhadra Dam and is expected to permit navigation upto 166 km.

**Buckingham Canal :** The Buckingham canal, one of the longest in the world with a total length of 415 km., runs through the two States of Andhra Pradesh and Tamil Nadu almost parallel and close to the east coast. It is a tidal canal, exclusively constructed for navigation by joining a series of natural backwaters and connecting all the coastal districts from Guntur to South Arcot. It is 315 km. long, north of the city of Madras, and 100 km. south of it. The northern part connects with the Commumur canal of the Krishna Delta which, in turn, is connected to the Godavari canal as far north as Kakinada. At the southern end, it terminates in the Mercanum (Marakkanum) backwaters.

The history of the canal, one of the earliest feats of engineering in the last century, runs back to 1801. From a 17.7 km. long canal from the Madras city to the southern end of the Ennore backwater, it was later extended to Pulicat lake and called 'Cochrana Canal' after Basil Cochrane who owned it and levied tolls for 45 years till 1847. It was then acquired by Government and gradually extended to 111 km. to

the north at Dugarazapatnam and 64 km. south to the Palar river. The northern part, called the East Coast canal, was extended by 1876 to Krishnapatnam, 148 km. north of Madras, thereby bringing the important town of Nellore within reach of a short length of road to connect the town. In 1878 it was named Buckingham canal after the then Governor of the State (Duke of Buckingham and Chandos).

Until the construction of the railway connection to Nellore, the canal was the principal means of transportation for passengers and goods between Madras and Nellore. In 1877 the canal was extended to 183 km. north, when thousands of persons affected by the Great Famine were employed for excavation work on the Pennuru river. By the end of the following year, the canal was extended to its existing northern limit, the junction of Pedda Ganjam by means of a lock with a lift to the fresh water high level Commomore canal of the Krishna Delta system. The length of the canal north of the Cooum river, 316 km. has since been known as the North canal.

As regards the southern part, the connecting cut, called the Junction canal, between the Cooum and Adyar rivers in the town of Madras was constructed by 1877. By 1882 the entire length of 106 km. to the Mercanum (Marakkanum) backwater, called the South canal, and the several bridges, including the Junction canal, were built. Thus the year witnessed the completion of 421 km. of open excavated channels consisting largely of cuts joining backwaters with but one regulating lock. The silting of the canals and the need to avoid risks of river floods or storm wave backing into the canal led to changes in design and between 1892 and 1897, the flood gates were converted into locks and openings to the sea and long surplus escapes were formed in the eastern bank of the canal.

The economic importance of the canal in the last century to the districts traversed by it was indicated by the fact that, until the advent of the railway, the canal was the only means of transport of passengers and goods between Nellore and Madras. In the early eighties, the cost of transport by the Buckingham canal varied from 2 to 3 pies per ton per mile as against 3 annas 2 pies by road. The volume of traffic on the canal in 1882-83 consisted of 24,982 trips of laden boats, 2,817 trips of empty boats, 7,970 trips of passenger boats; 337,992 tons; 4,961,087 ton goods valued at Rs. 100.35 lakhs; number of passengers 98,802; and tolls and licence fees Rs. 99,758.

After the completion of the entire length, the canal placed the city of Madras in cheap and easy communication with the important towns of Kakinada, Vijayawada, Masulipatanam, Nellore and numerous small trade centres.

The canal is ordinarily fit for navigation all the year round for traffic to be carried by boats from 5 to 30 tonnes. With the coming in of the

railways, the diversion of traffic, sometimes even deliberately, led gradually to the neglect of the canal and the silted-up condition, in the absence of proper maintenance, contributed to still further deterioration. Nothing was done despite public agitation in 1910 and even the acute shortage of rail and shipping facilities during World War I failed to spur action towards improving the canal. It was only during the Second World War under the stress of exceptional strain on rail and road transport that Government took steps to keep the canal in working condition. From 1940 to 1944 the amount spent on improvements was Rs. 18.4 lakhs. These included a masonry lock near Pulicat lake, six cargo boats, power tugs for pulling boats, rivetting of banks and berms of the Junction Canal in Madras connecting the Northern and Southern canals. There was also a proposal to connect the Buckingham canal with the Vedaraniyam canal in the Tanjore district which would provide direct communication from Kakinada to Point Calimere and thence to Ceylon (Sri Lanka).

From 238,772 tonnes carried during the pre-war year 1938-39, the traffic rose to 487,700 tonnes in 1943-44. It declined in the following years, touching 120,321 tonnes in 1953-54. There was, however, an improvement to 291,506 tonnes during 1957-58. The Inland Water Transport Committee 1959 drew attention to some of the disabilities from which the canal suffered, such as inadequate maintenance, lack of head room in the two railway bridges in the Madras City area, the lack of terminal facilities, inadequate road connection with important railheads and towns, absence of regular tow paths, difficulties in obtaining fresh water supplies and lack of proper warehouses to avoid detentions to craft.

**Vedaranniyam Canal:** The Vedaranniyam canal, taking off from the Kudavayyar river, connects the Vedaranniyam town, a large salt manufacturing centre, with the port of Nagapattinam. It has silted up in a number of reaches and the construction of the railway line, Tirutturai-pundi-Agasthyampalli, has deprived the canal of its importance. It was originally built to meet the transport needs for moving such commodities as salt, fuel and rice. About 1,000 boats used to ply on this canal, but the number has dwindled to 110 licensed boats carrying about 7,112 tonnes of cargo, made up of local produce, such as fodder, firewood and dry fish. A proposal to connect the southern arm of the Buckingham canal with the Vedaranniyam canal was under consideration, and this, if given effect to, will extend the waterway right from Kakinada to Vedaranniyam, over a distance of 966 km.

**Kerala Waterways:** A large number of westward flowing rivers, marshy submersible lands, lakes and backwaters and link canals along the coast have combined to provide one of the most important networks of water

transport in the State of Kerala. The system of waterways extends from Hosdurg in the north to Trivandrum in the south. The continuous chain of backwaters and lagoons is separated from the coast by a narrow strip of land, varying from about 11 km. to less than half a km. The extension to Trivandrum was effected by tunnels through the Varkala barrier enabling the canal to get through. The nine sections into which these waterways are divided are as follows:

|                    | <i>Km.</i> |
|--------------------|------------|
| Hosdurg — Azhikkal | 55         |
| Azhikkal-Badagara  | 49         |
| Badagara-Kadalundi | 72         |
| Kadalundi-Ponnani  | 61         |
| Ponnani-Ala        | 80         |
| Ala-Cochin         | 35         |
| Cochin-Aleppey     | 71         |
| Aleppey-Quilon     | 75         |
| Quilon-Trivandrum  | 62         |

The Kerala waterways have attracted a number of industries and products close to them, such as timber, plywood manufacture, coconut, coir products, arecanuts, shell, lime, tiles, bricks and clay, pepper, ginger, vegetables, rice, fish and other products of the region, besides coal and petrol. The ease of access to a number of minor ports and the major port of Cochin affords special advantages to the trade and commerce in the State.

Of the 41 rivers, seven are important for navigation, connecting the interior parts of the State to the backwaters. The total volume of traffic carried on the waterways, according to a recent Traffic Survey Kerala Waterways was placed at 2.3 million tonnes. Thousands of *valloms* (country boats) give employment to a large number of people in plying them, and in ancillary services, such as loading and unloading, and serve the needs of cottage industries established all along the coast. These depend mostly on water transport. Most of the industrial and commercial centres like Trivandrum, Quilon, Kottayam, Changanassery, Alwaye, Trichur, Feroke and Calicut, have either directly or through link canals access to the west coast canal system which itself passes near or through the main ports of the State, namely, Trivandrum, Aleppey, Cochin, Calicut, and Cannanore.

The Inland Water Transport Committee drew attention to some of the improvements required to develop the water transport facilities, such as the deepening and widening of the channels, more adequate terminal facilities, navigational aid, new locks between Ponnai and Chetwai, raising the headroom of road bridges, replacement of existing locks by larger ones, maintenance of minimum width of about 15 metres and depth of 1.82 metres at low water, except in part of the northern section of the canal, new tunnels at Varkala, if the traffic potential justified, and the extension of the canal from Badagara to Mahe.

These recommendations have been gone into in greater detail by the State Government and action on some of them has been taken by it.

As the coastal strip of the Karnataka State north of Mangalore is without any through lines of communication either by railway, road or waterways, and as the swift-flowing rivers with a drop of 600 to 900 metres to sea level within a distance of 64 km. are not navigable in the monsoon months, it has been suggested that, if the lagoons and backwaters formed in the lower reaches by these rivers are connected by a canal, it may prove to be a useful waterway between the two ports of Malpe and Mangalore.

**Inland Navigation in Maharashtra and Gujarat:** The two States of Maharashtra and Gujarat between them have the longest coastline of about 2,400 km. In the State of Maharashtra, there are, besides the major ports of Bombay and Marmagao, numerous minor ports having a considerable amount of traffic carried by powered vessels and sailing craft. A large number of rivers, creeks and tidal inlets of estuaries navigable from about 6 to 64 km. from their mouths, have combined to develop a closely inter-connected coastal and inland navigation system.

Among the navigable rivers may be mentioned the Vasishti and the Sabitri, both of which have potentialities of further development.

The Bombay Steam Navigation Company used to operate a regular passenger service between Bombay, Rewas Port, and Dharamatar Port on the Amba river and this was preferred for the reason that it is a much shorter route than that by road.

The Narmada river, 1,300 km. long and draining the large watershed of Central India, is navigable in its tidal compartment upto Broach, 48 km. from the mouth, by vessels of 70-80 tonne capacity and small country craft to Chandoo, about 64 km. upstream.

The Tapti river, which once nourished the port of Surat, has deteriorated considerably and sailing vessels can come upto Surat, 29 km. from the mouth only with great difficulty. Small country craft and bamboo rafts, however, can come upto Kathor. In view of the situation of the river, there is a proposal to shift the port down the estuary to Magdalla. The new industrial estate at Udhana, near Surat, is expected to provide adequate traffic potential for both coastal shipping and inland water transport.

Certain improvements effected after a hydrographic survey of the rivers and creeks, such as dredging to maintain adequate depth, navigational aids for marking shoals, rocks, etc., provision of tugs to assist country boats in tidal stretches to secure better turn-round, have been suggested to extend the scope for inland water transport in this part of the country. Long-term measures for extensive afforestation on the foothills of the catchment area have also been recommended.

The development of water transport on the ~~Thana and Banasia~~ creeks and the Ulhas river is expected to afford relief to the ~~present bottleneck~~ in transport in Bombay

**Rajasthan Canal:** The Rajasthan canal, the construction of which has been recently undertaken, can well combine irrigation potentialities with facilities for inland water transport. The navigational requirements, however, have not been taken into account in the present plans for the canal, but new railway facilities have been provided to meet the needs of the areas adjacent to the canal.

**Present State of Inland Water Transport:** Inland water transport has suffered from neglect for over a century. The real weakness of the situation, according to the Inland Water Transport Committee, lies in "the almost complete absence of expert technical organization conversant with, and having practical experience of, various complexities of the inland water transport, both in the Government of India and in the State Governments mainly interested, e.g., Assam, Bengal, Orissa, Andhra Pradesh, Kerala and Bombay." Despite the revival of interest since independence in developing inland water transport, there has been even during recent years a decline in the activities connected with it. On the Calcutta-Assam river route the cargo carried up and down between 1958 and 1962 decreased from 755,122 to 406,420 and from 525,096 to 406,420, respectively. The factors which have stood in the way of the progress of inland water transport have been (a) the railways and roads running parallel to the canals; (b) the priority generally given to the claims of irrigation as against those of navigation; (c) the absence of any industrial site in the proximity of any natural waterway; and (d) the low operational efficiency of inland water transport because of obsolete craft which have outlived their normal life and the near-primitive methods of handling cargo.

The country boats, the design of which varies from State to State, being adapted to the limitations of particular waterways and the traffic handled, are still the mainstay of inland water transport. The propulsion is by oar, sail or towing lines, and the use of power is almost non-existent on grounds of cost. These boats use waterways where powered craft cannot be used. Except in port areas, they are seldom registered or subjected to periodical surveys, and their operations are restricted by excessive tolls at ferry *ghats* in many places. More efficient utilization of country boats depends on better organization, improvement in design standardization and suitability to powered propulsion.

The Transport Development Council makes a periodical review of the condition of inland water transport. The working of a Directorate of Inland Water Transport in the Ministry of Transport since 1967 is

intended to maintain an overall watch on matters connected with the revival and sustained expansion of water transport in the country.

The subject "Shipping & Navigation on Inland Waterways as regards mechanically propelled vessels" is included in List III (Concurrent List) of the Seventh Schedule of the Constitution. The executive responsibility for the development of inland waterways and navigation thereon rests with the State Governments, unless any waterway is declared as "National Waterway" by law by Parliament. No waterway has so far been declared as a National Waterway. The river conservancy and any other measure for the improvement of any waterway are, therefore, the concern of the State Governments.

**Plan Outlays:** The expenditure on the development of Inland Water Transport during the Third Plan period and the succeeding three years and the outlay proposed under the Fourth Plan are shown below:

Public Sector Outlay on Inland Water Transport

(Rs. Crores)

|         |              |       |
|---------|--------------|-------|
| 1961-66 | Third Plan   | 4.00  |
| 1966-69 | Annual Plans | 6.00  |
| 1969-74 | Fourth Plan  | 13.00 |

The proposed expenditure during the Fourth Plan includes provision for Central schemes, namely, the Rajabagan Dockyard at Calcutta for the Central Inland Water Transport Corporation, technical organization, training schemes, and the development of the Pandu and Jogigopa ports. The Centrally-sponsored schemes are expected to cost Rs. 4 crores.

### V. Shipping

The finds of Egyptian, Assyrian and Indian archaeologists have confirmed the sea faring activities of Indian traders long before the Christian Era. India's maritime activity appears to have attained considerable expansion in the East during the latter days of the Gupta Empire and the period of the Chalukyas and Cholas, taking within its sweep the Indian Archipelago, the China Sea and even Japan.

Coming to later times, the testimony of Ibn Batuta points to the concentration of foreign commerce in Gujarat, Malabar and the Konkan and the participation of Indian and Arab ships in this trade. Niccolo Conti in the 15th century makes mention of India-built ships — "some ships longer than ours, capable of containing 2,000 butts and with five sails, and as many masts." He added: "The lower part is constructed with triple planks to withstand the force of tempests, to which they are much exposed." Some were "so built in compartments that, should one part be shattered, the other remaining entire may accomplish the

voyage." Calicut was regarded as one of the greatest ship building centres in India, executing orders from even foreign countries.

During the Mughal Empire, the development of shipping and inland navigation was under the care of a specialized branch of administration. A special admiralty was created during Akbar's reign with special specific functions assigned to it, namely, supplying big ships and boats, supervising construction of big ships, supplying trained personnel of various grades running into 12 main categories, superintendence of boats, ships and their operations, and collection and remission of port dues.

With the coming in of European powers to engage in the East Indies trade, the existence of Indian shipping was threatened and it came to be gradually eliminated. The policy followed by them was clearly enunciated by Francisco Almeida, the first European Viceroy of the Indies to his Sovereign: "Let it be known to your Majesty that, if you are strong in ships, the commerce of the Indies is yours; and if you are not strong in ships, little will avail of any fortress on land." This policy has been sedulously followed in later years by the Dutch and finally by the British power to the detriment of Indian shipping and its final disappearance from foreign waters and later even from her own coastal trade.

Ship building, however, persisted, flourishing under the East India Company right upto the middle of the 19th century. In 1800, Lord Wellesley referred to "the state of perfection which the art of ship-building has already attained in Bengal, promising still more rapid progress and supported by abundant and increasing supplies of timber" and to the ability of the port "to furnish tonnage to whatever extent it may be required for conveying to the port of London on the trade of the British merchants of Bengal".

The art of ship building was in so excellent a condition that ships built in India sailed the Thames in company with British-built ships under the convoy of British frigates. The teakwood vessels of Bombay were greatly superior to the "Oaken Walls of Old England" and for this reason, Lt. Col. A. Walker, argued for a policy of drawing on Indian resources and skill for supplying the needs of British Navy and merchant fleet. The teakwood built ships lasted fifty years against the ships of the British having to be renewed every twelve years. While no Europe-built ship was capable of doing more than six voyages in safety, Bombay-built ships, after running for fourteen or fifteen years, were bought by the Navy. The authority just quoted assessed the difference in favour of India-built ships at 325 per cent. In view of the greater durability and economy of Indian ships, British ship building interests scented danger. According to Taylor, "The arrival in the Port of London of Indian produce in Indian-built ships created a sensation

among the monopolists which could not have been exceeded if a hostile fleet had appeared on the Thames. The shipbuilders of the Port of London took the lead in raising the cry of alarm; they declared that their business was on the point of being ruined and that the families of all shipwrights in England were certain to be reduced to starvation."

**Discrimination Against Indian Ships:** The cry prevailed and stirred acts of hostility on the part of the British Government, such as the banning of Indian ships from British waters and the Government of India imposing discriminatory and crushing duties on goods imported on Indian bottoms. H.H. Wilson observed: "The foreign manufacturer employed the arm of political injustice to keep down and ultimately strangle a competitor with whom he could not have contended on equal terms." Indian shipbuilding had to perish so that British shipbuilding industry could flourish. These, and not the advent of steamships and iron and steel replacing wood, as often alleged, led to the decline of the Indian ship building industry.

Between 1857 and 1898-99, the Indian vessels entered and cleared, declined from 34,286 to 2,302, and the tonnage from 1,219,958 to 133,033. Over the same period, while the British vessels dropped from 59,441 to 6,219, the tonnage rose from 2,475,472 to 7,685,009. Foreign ships, which had by this time entered the picture, accounted for 1,165 vessels and 1,297,604 tons.

It was during the period of World War I that it came to be realized that the difficulties connected with the shortage of shipping would have been substantially less had an Indian shipping industry been in existence. The Indian Industrial Commission, 1916-18, recognized the need for developing Indian shipping and for training officers and engineers in connection therewith. The progressive disappearance of a large part of world shipping and an evident shortage of tonnage caused by the submarine menace during 1914-18 pointed to the importance of India having her own merchant fleet in any replacement programme. Beyond the creation of a shipbuilding branch in the Indian Munitions Board and getting an officer on loan from the British Admiralty, nothing further was done. Government held that it was not possible to make any progress during the war towards the building of steel ships and that encouragement of wooden ships alone was possible.

**Indian Shipping during Inter-war Period:** The Scindia Steam Navigation Company Ltd. was started in 1919 with a passenger steamer and six cargo boats. Its history has been for the national shipping companies a sad story of ceaseless struggle and sacrifice; a painful chapter of bitter disappointment at the lack of response from the then Government of India to their demand for stability and expansion.

The inter-war period, 1919-1939, is important. During these twenty-one years, most maritime countries of the world tried to build up their merchant fleets. Every maritime country of any importance had for reasons of national security and economic needs, increased its own fleet. What was happening in other parts of the world was, however, of no concern to the Government of India. India continued to be a glaring exception to the recognition of the duty of the State to develop a national merchant marine. The patronage of the Government and all that went with it were enjoyed by the British Indian Steam Navigation Company (B.I.S.N.). It received subsidies for the carriage of mails and had first admission to the docks. Government servants proceeding abroad travelled by the P & O (The Peninsular & Oriental Navigation Company) of the same group. During the thirties, Government servants were even compelled to travel by these services at the risk of being penalized.

During the twenties and thirties, all the Indian companies, newly started, found themselves opposed by the British interests. They were faced with ruthless rate cutting and severe competition from the British Indian Steam Navigation Company. Some of the Indian companies, financially sound and well-managed, had to be closed down. The Scindia Steam also had to experience the hostility of the B.I.S.N. in 1920 itself. This was by no means a new experience. When the freights on Indian yarn were so high as to make it impossible to retain the Chinese market for the Indian yarn, the late J. N. Tata chartered a few boats to carry the yarn at reasonable rates. The P & O would not tolerate the entry of any Indian enterprise into overseas trade which it held to be its monopoly; it slashed the rates from Rs. 16/- to Re. 1/- per maund. When the Indian company withdrew from so relentless a competition, the rate was raised from Re. 1/- to Rs. 17/-. The Bengal Steam Navigation Company, which went into liquidation in 1910, had, when it came into existence, to face a rate war in 1905 on the Chittagong — Rangoon run, when the B.I.S.N. cut the fare from Rs. 12/- to Rs. 6/- per deck passenger and the rates from Rs. 14/- to Rs. 4/- per maund, adding free distribution of sweets and handkerchiefs to its patrons. When the Indian company was driven to the wall, the B.I.S.N. raised the fares to Rs. 14/- to make up for the loss from the rate war.

In the early thirties, four small Indian companies, the Eastern Navigation Company, the Malabar Steamship Company, the Merchant Steamship Navigation Company and the National Steamship Company had to face cutthroat competition from the B.I.S.N. and the National Steamship Company even ceased to exist. No company was secure till it found a place in one of the Shipping Conferences and even after being admitted, it had to submit to the decisions of the predominant partner, the B.I.S.N.

**Indian Mercantile Marine Committee:** Following the adoption of a resolution in the Council of State in March 1922, the Indian Mercantile Marine Committee was appointed to consider measures to be taken for the development of shipping and shipbuilding.

The Committee, reporting in 1924, recommended:

I. Reservation of coasting trade by a system of licences which should be issued on the following conditions:

- (1) To no foreign ship except in so far as protected by treaty rights.
- (2) To any ship flying the British flag provided that (a) it has been regularly engaged in the coasting trade during the preceding twelve months and is not more than 25 years old, (b) the owner undertakes to take Indian apprentices and Indian Executive Engineer Officers on scales recommended. and (c) the licence shall continue only until the ship has reached the age of 25 years.
- (3) Any ship hereafter seeking to enter the coasting trade shall comply with the conditions that the ownership and controlling interest shall be predominantly Indian, viz., (i) registered in India and (ii) owned and managed by an individual Indian, or by a company registered in India with rupee capital, with a majority of Indians on its Directorate and majority of its shares held by Indians

II. Purchase by Government of one of the existing British lines operating on the coast and its eventual transfer by sale to Indian owners.

The Committee also recommended that, if the Law Officers of the Crown held that the licensing proposals conflicted with Section 736 of the English Merchant Shipping Act 1924, either the Act should be amended or Indian-owned and Indian-managed ships should be assisted by (i) bounties; (ii) mail contracts; (iii) carriage of Government stores, whether in the coasting or in the overseas trade

Several attempts were made to reserve coastal traffic to Indian ships. The bill introduced by S. N. Haji in 1928 lapsed on the dissolution of the Central Assembly. A conference convened by the Government of India in 1930 with the representatives of all interests concerned with a view to contributing to a solution for the adequate participation of Indian shipping in the coastal and overseas trades of India and to securing, if possible, an agreed settlement, broke up without any agreement. The breakdown was attributed to the complete apathy of Government in protecting Indian shipping interests and the powerful opposition of the foreign lines. On April 1, 1934, a Tripartite Agreement between the B. I. S. N. Scindia and the Asiatic Companies provided for (a) the cargo carried by the vessels of the three companies in the coasting trade of

India, Burma and Ceylon, being regulated and apportioned according to specified percentages; (b) the Scindia Company being permitted to carry passengers on the Rangoon-Coromandel coast and the Rangoon-Chittagong run; (c) the total gross tonnage of the Scindias being raised to 100,000 gross tonnes; (d) the rates of freight and fares for passengers being jointly fixed in writing by the parties after mutual consultation and consent, and strictly adhered to; and (e) any dispute or difference to be decided by arbitration. In addition, the Scindias agreed to respect the P & O Company's and B.I.S.N. Company's foreign (Overseas) trade and not to compete with them in these services. The agreement was to have expired in 1939, but the efforts to revise it did not receive any Government support and this agreement controlled the situation even after World War II.

The case of smaller companies operating in the west coast was the subject of intervention by Sir Joseph Bhole, the then Commerce Member, and a reservation of 85 per cent of the trades in these areas was secured for them by Government.

The Indian Mercantile Marine Training ship "Dufferin" was established at Bombay on December 1, 1927, initially for three years and continued thereafter as a permanent institution. Starting first on training executive officers, the Institution under-took training of Marine Engineers as from 1937. The "Dufferin" has over the years made an important contribution to the needs of Indian shipping. At the end of the first twenty-five years of its establishment, 575 officers trained by it were found serving in the Indian Navy and the merchant ships. By 1966-67, 2,026 had been trained at the "T. S. Dufferin". It has also in recent years extended its facilities to the neighbouring countries. The "Dufferin" has now been replaced by a new training ship Rajendra.

**Post-War Shipping Policy:** A change in policy was indicated in the Post-War Shipping Policy laid down in the Second Report on Reconstruction and Planning, issued in 1945, as follows:--

"For a country of its size, length of coastline and strategic position athwart one of the world's main sea routes, India possesses a distressingly small number of deep sea ships which, at the outbreak of war, stood at no more than 30 with a total of less than 150,000 tons gross. India's weakness in this respect has long been recognized, and the Government of India are pledged to a policy of assisting in the development of an Indian Mercantile Marine. So far, however, the action taken to implement this undertaking has been limited to the establishment of the "Dufferin" for the training of executive officers, the provision of special facilities for the training of marine engineers and to using Government's good offices to promote a settlement between the Indian and British

Companies operating on the coast with regard to the division of the available trade between them.

"The vulnerability of India's position has been revealed by the stress of wartime conditions, but by no circumstances more glaringly than by her inability to find adequate shipping from her own resources to provide for the transport of the food supplies required by her. The rectification of this state of affairs should be one of the immediate post-war objectives, not only for commercial reasons but also because the development of the Royal Indian Navy necessarily implies the concurrent development of the merchant navy.

"The acquisition of an adequate share in the world's carrying trade should be the aim of our post-war shipping policy, and to this end steps should be taken to secure for Indian shipping — (i) an increased share of the coastal trade, including trade with Ceylon and Burma (the present share is estimated at between 20-30 per cent); (ii) a substantial share in the near trades, *e.g.*, Persian Gulf, East Africa, Malay and the Dutch East Indies; (iii) a fair share in the Eastern trades, especially those trades of which Japanese shipping will have been dispossessed; and (iv) a fair share also in the trade between India, on the one hand, and the U.K., and the Continent of Europe and North America, on the other."

The Reconstruction Policy Sub-committee on Shipping was appointed on November 10, 1945 to recommend a suitable tonnage target for Indian shipping to be attained within a period of five to ten years and the percentage share of the maritime trade of India — both coastal and overseas, cargo and steamer — to be secured for Indian shipping.

The sub-committee submitted its report on January, 20, 1947. Defining Indian shipping as "shipping owned, controlled and managed by the nationals of India", the sub-committee recommended 100 per cent reservation of coastal trade, 75 per cent of adjacent trade, and 50 per cent of overseas trade. It also set a target of 2 million gross tonnes of shipping to be acquired within a period of five to seven years. Further, it recommended financial aid to Indian shipping companies engaged in overseas trade. As regards shipping organization, it recommended the setting up of a Shipping Board which would be "the spear-point of policy locally and internationally" with power to license coastal vessels and to suggest proposals for the removal of all evils of monopolistic exploitation. The Government of India generally endorsed the dynamic policy on shipping stressed by the sub-committee and its implications.

In accordance with the decision of the Government that the public sector should participate in the shipping industry, the Eastern Shipping Corporation was incorporated on March 24, 1950 with its Head Office at Bombay, as a public company under the Companies Act as a joint venture with the Scindia Steam Navigation Company, the latter holding 26 per cent of the shares and acting as Managing Agents. On August 15,

1956, the management was taken over by the Central Government and the shares owned by the Scindias were acquired in 1957. The Western Shipping Corporation, wholly owned and managed by Government was incorporated under the Indian Companies Act on June 22, 1956. In view of the practical difficulties in the day-to-day management of two separate companies and, as the merger of the two would eliminate duplication and lead to economy in the long run, the undertaking of the Western Shipping Corporation was transferred to, and stood vested in the Eastern Shipping Corporation, with effect from October 2, 1961, which was renamed "The Shipping Corporation of India Ltd." wholly owned by the Government. The authorized capital was Rs. 35 crores (combined authorized capital of the two companies) and the paid-up capital Rs. 23 crores. The trading activity of the Corporation — transport of goods and passengers by sea — was carried on with its own fleet, as of February 1970, of 70 vessels which included cargo ships, passenger-cum-cargo ships and tankers to a total dead weight tonnage of 1,056,000.

The Western Shipping Corporation had acquired during 1960 the shareholding of 80 per cent (80, 180 shares) of the "Mogul Line", making it a subsidiary. As of 1970, the Line had a fleet of three passenger-cum-cargo vessels, a collier and a tanker aggregating to a Gross Registered Tonnage (G.R.T.) of 42,500 and catering mainly to the pilgrim traffic on the India/Red Sea route. It is the oldest Indian registered shipping company, having been registered in Bombay on August 2, 1877 as the Bombay and Persia Steam Navigation Company. In 1939, the name was changed to the Mogul Line Ltd. With the amalgamation of the Western Shipping Corporation and the Eastern Shipping Corporation, it became a subsidiary of the Shipping Corporation of India. On March 30, 1952, the shares were transferred to the President of India and it ceased to be the subsidiary of the Shipping Corporation as from that date. The policy of Government has been to extend and diversify the existing trade. It has resumed the shuttle services on the Madras/Rangoon route and is expected to operate colliers.

**Terms of Financial Aid to Shipping:** The expansion of Indian shipping since 1950-51 has been assisted by State financial aid to shipping. This has varied, in the case of overseas vessels, from 85 to 95 per cent for vessels built new and upto 75 per cent for second-hand purchases, the interest charged being  $2\frac{1}{2}$  per cent per annum and the rate being raised to 8 per cent in the event of default. The repayment of the loan is spread over a period of (not exceeding) 12 to 15 years in respect of new vessels and not exceeding two-thirds of the unexpired life in the case of second-hand vessels. The loans carry backing by adequate security acceptable to Government covering the amounts outstanding plus 33.33 per cent by mortgaging the vessels concerned and such other assets as

may be necessary. As regards coastal vessels, the loans, the quantum of which not exceeding 85 to 90 per cent for vessels built new and 66.66 to 75 per cent for purchases of second-hand vessels, are at 4 to 4.5 per cent per annum, subject to penal rate at 8 per cent per annum in the event of default. The loan will be spread over a period not exceeding 12 to 15 years for new construction and not exceeding two-thirds of the unexpired life of the second-hand vessels. The interest charged will be 4 per cent only if the loan is repaid within four years. The security for the loan is governed by the same provisions as for overseas vessels.

Government has a whole time officer as Government Director on the board of each shipping company to which Government loans have been advanced for the acquisition of ships. He is charged with watching the interests of Government and sending periodical reports to it. In the case of smaller shipping companies, they are required in addition to implement any suggestion made by Government for better management of the company. The vessels subject to the loans are also required to be made available for periodical inspection by Government surveyors in regard to their maintenance and upkeep. In regard to all the vessels subject to Government loans, insurance against all risks (including war risk) for an amount 25 per cent in excess of the sums owing to Government is compulsory and the policies should be assigned to Government.

**Progress of Shipping under Five Year Plans :** The progress of Indian shipping is indicated in the Table below :

TABLE XVIII  
Progress of Indian Shipping, 1947-1969, (select years)

| Year           | Coastal |         | Overseas |           | Total |           |
|----------------|---------|---------|----------|-----------|-------|-----------|
|                | No.     | G.R.T.  | No.      | G.R.T.    | No.   | G.R.T.    |
| 1947 (Aug. 15) | 48      | 119,000 | 11       | 73,000    | 59    | 192,000   |
| 1951 (Apr. 1)  | 71      | 205,699 | 23       | 166,679   | 94    | 372,378   |
| 1955 (Dec. 31) | 92      | 220,960 | 33       | 255,347   | 125   | 478,307   |
| 1960 (Dec. 31) | 98      | 315,397 | 74       | 528,619   | 172   | 844,016   |
| 1965 (Dec. 31) | 110     | 337,895 | 116      | 1,122,086 | 217   | 1,459,981 |
| 1969 (Dec. 31) | 80      | 304,532 | 174      | 1,948,238 | 254   | 2,252,770 |

The number of passengers carried on coastal and overseas trades by the Indian shipping companies, shown in Table XIX, indicates a considerable decrease in 1963 under Coastal Services as compared with 1951.

The freight and passenger earnings of Indian shipping companies since 1947 may be seen from Table XX. Taking the total earnings, there has been an increase of 557 per cent as compared with 1947-48.

**Sailing Vessels Industry:** During the latter part of World War II, the sailing vessels traffic on the west coast was organized under the Defence of India Rules, with a view to affording relief to the railways and coastal shipping in the movement of essential items. During 1944-48, the sailing vessels had assisted in the movement of approximately 1.7 million tonnes of cargo. As, with the termination of control, the cargo as well as freight declined, the Government appointed, on representations from the industry, the Sailing Vessels Traffic Development Committee on May 24, 1948, to examine and report on the steps necessary to ensure the fullest utilization of country craft (sailing vessels), to sustain and develop the economy of the country and *inter alia* to prevent wasteful competition between country craft and steamers, due regard being paid to the differing needs served by the two classes of transport.

The committee submitted its report in May 1949. Its findings were

that the sailing vessel had to be a considerably much more safe, expeditious and efficient unit of transport than it was, that the personnel afloat had to be considerably much more trained, competent and reliable and that the trade had to be reorganized, preferably by voluntary action. A number of detailed recommendations were made by the committee, such as bringing sailing ships within the scope of the Merchant Shipping Act, registry of such vessels etc. The recommendations were broadly accepted by Government and a special organization was set up in the Directorate-General of Shipping to implement Government policy in regard to the development of the sailing vessels industry.

A scheme has been prepared for the grant of loans for the mechanization of existing sailing vessels and for the construction of new sailing vessels, and it has been decided to place the funds at the disposal of State Governments which will disperse the loans to owners of vessels through co-operative societies. A Central Advisory Committee for Sailing Vessels has also been constituted to advise Government on major problems of an all-India character. In order to deal with local problems and to assist in the organization for the development of the industry region-wise, four Regional Advisory Committees have also been appointed at the ports of Bombay, Jamnagar, Tuticorin and Masulipatam.

There were, as on January 1, 1967, 3739 sailing vessels, including 103 mechanized with a carrying capacity of about 240,000 Dead Weight Tonnage (D.W.T.).

**Merchant Shipping Act 1958:** The Merchant Shipping Act enacted by Parliament came into effect on October 30, 1958. The Act is intended to foster development, and ensure the efficient maintenance, of the Indian mercantile marine in a manner best suited to serve the national interests. It provides for the establishment of a National Shipping Board, a Shipping Development Fund and the registration of Indian Ships. All the statutory rules, regulations, orders, etc., under the Act have been brought into force on January 1, 1961.

**Shipping Development Fund:** Among the statutory bodies created under the Merchant Shipping Act 1958, is the Shipping Development Fund Committee. This committee has been set up to provide financial assistance to Indian shipping companies for the acquisition of tonnage. The Merchant Shipping Act, 1958, provided for the establishment of a non-lapsing fund on a statutory basis. The fund, which was established in March 1959, is intended to serve as a continuous source of finance from which loans can be granted to Indian shipping companies.

The Government of India has been giving financial assistance to the shipping industry since the beginning of the First Five Year Plan in the

form of loans to the shipping companies in the public and private sectors for the acquisition of ships and for investment in the public sector shipping companies. During the period of the First Five Year Plan, a total amount of about Rs. 18.7 crores was spent. The total provision for the Second Five Year Plan was Rs. 54.25 crores for the expansion of tonnage. Of this, a sum of Rs. 18.83 crores was invested in the public sector shipping companies and a total sum of Rs. 23.44 crores was advanced as loans to the shipping companies. The balance of Rs. 11.9 crores was advanced to the Shipping Development Fund. The Third Plan expenditure was Rs. 40 crores. The expenditure during the annual plan periods of 1966-69 was Rs. 25.4 crores.

The outlay for the Fourth Plan is Rs. 140 crores, of which Rs. 135 crores are for the acquisition of ships. By the end of the Fourth Plan a target of 3.5 million G.R.T. is expected to be reached.

**Shipbuilding:** The construction of a shipyard at Visakhapatnam was the first major enterprise of its kind in the country. Although the progress of construction was interrupted since the beginning in June 1941 owing to the war, it was completed by stages by 1946 on 21.85 hectare with two berths, the total provision being for eight berths and necessary workshops. To start with, it was financed entirely by private enterprise, namely, the Scindias who got four 8,000 tonners built for their own use. Owing to high costs of construction and the inability of the Scindias to keep the yard going, Government assistance was given by placing orders for three ships. Government, however, decided to take over the yard and, on January 21, 1952, a private company called the Hindustan Shipyard Ltd., was formed and on March 1, 1952, the yard was taken over by it at a valuation of Rs. 2.72 crores. Two-thirds of the shares, valued at Rs. 2.09 crores were taken by Government, the remaining third being retained by the Scindias. A debenture loan of Rs. 60 lakhs given during 1952-54 was later converted into share capital, the Government holding thus being raised to Rs. 2.69 crores. On March 31, 1961, Government acquired the shares of the Scindias also, namely, Rs. 104.25 lakhs, for Rs. 80.38 lakhs.

Government has been bearing the difference between the actual cost of construction in the yard and the cost of similar ships in the U.K. which is the price at which these ships were sold by the Hindustan Shipyard to the shipping companies. Soon after the formation of the company, an agreement was entered into in July 1952 with the French firm of shipbuilders "La Societe Anonyme Des Ateliers et Chantiers de La Loire" (The "A C L") for technical aid in management and operation of the yard.

The yard has been developed to enable it to construct ships of various sizes. In recent years it has been building overseas liner vessels of

about 10,000 to 12,000 D.W.T. From being able to build three ships a year, its capacity is being increased to building six ships a year.

A second shipyard is to be constructed at Cochin and 25.6 hectare of land have already been acquired, leaving an area of 13.6 hectare to be handed over by the Kerala State Government. The shipyard is to be constructed in collaboration with Messrs Mitsubishi Heavy Industries, Japan.

## VI. Ports

Although the geographical position of India is favourable for international trade in view of the projection of the great peninsula into the Indian Ocean and the long coastline presented to the navigator facing west, there is a singular paucity of large natural harbours. On the west coast, during the monsoon months, navigation practically ceases when the rocky shores are furiously beaten by wind and waves. During this period, at only a few ports on that coast is an intermittent activity permitted. On the east coast of India, the absence of natural harbours is even more striking. However, the natural deficiency has been overcome by human effort, as typified by the case of the Madras Port.

Extensive maritime trade with countries to the east and west of India more than two thousand years ago, as referred to earlier, had made many of the ports of call on the coast of the sub-continent well-known to sailors and merchants of antiquity, such as Bharugachha (Broach), Naura (Cannanore), Comari (Cape Comorin), Postuea (Pondicherry) and Camara (Kaveripatnam). The importance attached to ports and harbours during the Mauryan times is seen in the details relating to their maintenance and administration in Kautilya's *Arthashastra*, such as the references to the department responsible for controlling ports and harbours and the functions of the State officer who helped boat fleets which had lost their courses in unfavourable winds, collected taxes on boats and ships, etc. Many of the ports and harbours must have maintained their activities in connection with foreign trade in the following centuries.

The advent of European powers and their settlements for trade led to the beginnings of those large ports which have now come to handle the bulk of the country's international trade. Till the supremacy of the East India Company was established, the struggle for power between the Portuguese, Dutch, French and English led to the setting up of a number of settlements on both Malabar and Coromandel coasts as well as to the north of these coasts. The ports which were developed by the East India Company, namely, Madras, Bombay and Calcutta, emerged later as the most important ports. To these were later added Karachi, Cochin and Visakhapatnam. Prior to independence these six constituted

the principal ports. The great bulk of India's foreign trade prior to the partition used to be concentrated at Karachi and Bombay, these being the principal channels for the trade of north-western and western India. There were, however, a large number of smaller ports used by smaller vessels and other craft.

**Beginnings of Calcutta, Bombay and Madras Ports:** The East India Company established a factory in 1690 at the site of Calcutta, about 129 km. up the river Hooghly. Until the opening of the Suez canal and the linking of the interior with Bombay and Karachi, the trade of India with foreign countries was largely conducted from Calcutta. By 1864, railways extended from Calcutta to Delhi, the line being laid through the most productive tracts of northern India and following, in the main, the course of the Ganga, which was formerly the easiest highway of commerce, and the Grand Trunk Road. The extension of the railway system in north-eastern India added year by year to the sphere of influence of Calcutta as a port and a distributing centre. To meet the requirements of its increasing trade, it became necessary to improve the conditions of the port. The primitive system of mooring in the stream and loading and discharging the cargo by lighters was superseded by the construction of jetties and wharves along the Calcutta foreshore of the river, and later by the construction of docks at Kidderpore to which railway wagons could bring merchandise alongside the steamers. At the same time, the service of steamers on the river highways between Calcutta and Assam was greatly improved and developed to meet the rapidly increasing needs and output of the tea estates. The reduction of rates between Calcutta and Rangoon stimulated the trade of the former with Burma. Still greater came to be its importance with the rise of industrial enterprise and the exportation of jute and jute manufactures from the port to all parts of the world. From small beginnings, the port has grown to the size of a major port of international importance.

The East India Company, which had, after defeating the Portuguese, established itself at Surat, foresaw the future of Bombay. In 1668, the island was transferred by Royal Charter to the Company for an annual rent of £10 by Charles II who had obtained it from Portugal as part of his marriage contract. The East India Company thereafter promulgated measures for the encouragement of trade to and from Bombay. The construction of a Custom House, a warehouse and a mole capable of berthing small ships was taken in hand and a shipwright was sent out from England to supervise the Company's shipbuilding operations. Gerald Aungier, President of the Surat Council and Governor of Bombay, thus summed up the natural advantages of Bombay: "The great bay or port is certainly the fairest, largest and securest in all these parts of India, where a hundred sails of tall ships may ride all the year

safe with good anchorage." Development of communications with Bombay, though it started earlier than in eastern India, was not completed till a later date owing to the difficulties of the approaches to the island from the interior. The absence of docks also prevented trade during the monsoon months. The cotton famine, caused by the American Civil War, 1861-66, gave an enormous impetus to the trade and prosperity of the city. Although this was followed by the most severe commercial crisis recorded, recovery was rapid, aided by the completion of the extension of railways to Jabalpur and Nagpur, and to Delhi and Agra. The opening of the Suez canal in 1869 also contributed to the great impetus given to the trade of western India with the West in the period following 1870 and this raised Bombay to the level of Calcutta as a commercial centre. The construction of the docks enabled the export business to be carried on all the year round without interruption by the elements.

The first Madras harbour was the Fort St. George, founded by Francis Day in 1639 on a sandbank at the mouth of the Cooum River to provide a safe place for the ships and the trade of the East India Company. There was no harbour at all in the usual sense, no pier or jetty even, nothing but a beach and very little of that. There was no trade in stormy weather and ships avoided the monsoon months. It was only in 1875 that attempts were made to construct a harbour by creating an artificial breakwater bounded by walls running into the sea, enclosing a space 0.91 km. (1,000 yards) long and 0.76 km. (830 yards) broad at a maximum depth of 7.5 fathoms. The harbour walls and piers were completed in 1881 and the harbour was fully opened to shipping. The area was calculated to afford shelter to 13 ships of various sizes, from 4,000 to 700 tonnes. A severe cyclone in November 1881 caused considerable damage to the works and, besides minor damages, two Titan cranes were thrown over and destroyed. It was not until Sir Francis Spring took up the matter in 1904 that the proper construction of the Madras harbour did actually begin. A new north entrance was opened in 1910, giving for the first time calm water inside the harbour. With the addition of a boat basin on the south side of the harbour, a timber pond and a slipway, as well as the construction of warehouses and provision of railway lines together with cranes and other facilities, the port had most of the improvements required to attract more trade to it.

**Ports during Second World War:** The working of the ports was affected by Japan's entry into the war. With the Japanese occupation of Burma, the Bay of Bengal was closed to shipping and the ships on the east coast were evacuated and the country's seaborne trade was diverted to Bombay, Karachi and Cochin. The situation was aggravated by the large influx into Indian ports of 'frustrated' cargo from Malaya and the

Netherlands East Indies and the arrival of military reinforcements on a large scale resulting in acute congestion on the west coast ports and serious delays to shipping.

On the recommendations of an Anglo-American Shipping and Ports Commission which visited India in November 1942, steps were taken to provide additional lighterage and lighter frontage to receive traffic in Bombay, new port equipment, especially cranes, in Bombay and Cochin, improvements to water facilities and oil discharge arrangements in Bombay and Madras, new barges at Cochin and lighterage at Visakhapatnam.

There was a swing of traffic in 1942-43, the brunt of which fell on Calcutta, and to cope with this a new modernized berth in Kidderpore Dock, two new ships berths and three flat-loading berths in King George's Dock were provided. Certain development works were also executed by the Army at Visakhapatnam.

In 1945, the Bombay Port experienced a major disaster from two large explosions in ships berthed in the Victoria Dock, resulting in heavy loss of life, damage to port installations and property.

**Ports Technical Committee 1946:** In 1945, an Inter Departmental Committee expressed the view that, although the existing capacity was adequate to meet the traffic offering, it was necessary to look ahead and keep ready plans for extending the port facilities. The Ports Technical Committee 1946 also supported this view and observed:

"If Government are resolved that the sea path round the coast of India is to be put to its best possible use, it is not only necessary that ports, major and minor, should be fitted to pass the trade but also that steps should be taken to rationalize the means of transport both by sea and land and discourage, in the national interests of the country, any unfair and uneconomic competition on the part of either."

"Finally, ports are vital links in the effective and efficient working of transport both by sea and land. And, while the establishment and expansion of ports will have to be related to the general development of trade and transport in the country, the Committee is convinced that the planning of ports and their construction and the service which they have to provide should, in the national economy of the country, precede the anticipated developments and needs of transport."

Recommending the development of Visakhapatnam Port as a deep sea port capable of accommodating ships upto 25.5 metre in length and draughts upto 9.1 metre with improvement of the entrance and the building of a dry dock and provision of other facilities, the committee stated that this should be taken up immediately, the entire finance for the project being found by the Government of India.

The policy recommended by the Ports (Technical) Committee was to

be based on the following broad considerations:

- (a) the economic indivisibility of British India and Indian States;
- (b) the increasing requirements of India's rapidly expanding agriculture and industries, as also the desirability of the dispersal of industries;
- (c) the integration and implementation of a comprehensive, well-balanced and efficient policy of transport and its effective development in all its forms;
- (d) the routing of trade through ports not to be influenced by customs policy;
- (e) the need for a long view in the siting of new ports and the development of existing ones;
- (f) the evolution of a sound policy of defence for the whole country;
- (g) the geographical position and importance of India in the Indian Ocean; and
- (h) the strategic importance of India in the development of a World Order in the Far East.

**Effects of Partition:** As a result of the partition of the country, two major ports, Karachi and Chittagong, went to Pakistan. In view of this, the trade formerly handled by Karachi had to be diverted to Bombay. The need for another major port on the west coast was felt and the West Coast Major Port Development Committee 1948, was appointed to investigate the location of a deep sea port on the stretch of coast covering Kathiawar and Kutch. The committee recommended the establishment of a port at Kandla in the Gulf of Kutch, the location of another port at Malpe and the development of the Bhavnagar Port. The Government of India, accepting the recommendation relating to Kandla, proceeded with the development of the port. The scheme also included the establishment of a township, Gandhi Dham, adjacent to the port.

**Characteristics of Major Ports and Minor Ports:** Under the Constitution major ports continue to be a Central subject, while minor ports appear in the Concurrent List. As from February 1, 1951, major ports have been placed under the administrative control of the Ministry of Transport, which is responsible for the general transport co-ordination and administration of major ports, marine shipping, lighthouses and inland water transport. A port is declared a "Major Port" if, by reason of the size and importance, it is taken under administrative control of the Central Government. According to the Ports (Technical) Committee, "the sheltered nature of a port, the well laid out approach channels, the provision of docks, jetties and moorings, the well laid out transit sheds, the effective rail connections, the ability to serve a very large portion of the hinterland lying behind the port, the facilities for meeting

the requirements of defence and strategy, the comparatively large volume of traffic and possibilities of work for shipping all the year round, usually distinguish a major from a minor port." The West Coast Major Port Development Committee added to these another criterion also, namely the ability to turn round the ship quickly. All major ports are capable of taking in ocean going steamers with a registered tonnage of 4,000 or more and berth them along their wharves.

Ports other than "Major" are classed as "Minor" and these present an amazing variety in size and functions, volume of traffic handled, financial position and administrative set up. The facilities provided may vary from nothing in some of the roadstead ports on the seaboard to fine elaborate harbours with dredgers and equipment, as in Saurashtra, from ports handling a few hundred tonnes to as much as half a million tonnes a year, from ports having an income of a few hundred rupees to those having a revenue of Rs. 6 to 8 lakhs a year, from ports well and efficiently administered to those which "also run". "Minor" ports are subject to the administrative control of State Governments which have complete responsibility for the running of these ports.

**Intermediate Ports Development Committee 1958:** The Government of India appointed the Intermediate Ports Development Committee in October 1958 to make recommendations regarding development of 'Intermediate' ports, ports which should be classed as coming between the "Minor" and the "Major" ports.

The committee submitted its report on April 30, 1960. The main recommendations of the committee were:

- (i) **First Priority Works (Rs. 621 lakhs):** for the ports of Paradeep, Kakinada, Masulipatam, Cuddalore, Nagapattinam, Tuticorin, Neendakara, Beypore, Calicut, Mangalore, Karwar, Redi, Ratnagiri, Surat, Broach, Bhavnagar, Veraval, Porbandar, Okha, Sika and Bedi.
- (ii) **Second Priority Works (Rs. 422 lakhs):** for the ports of Paradeep, Kakinada, Masulipatam, Cuddalore, Nagapattinam, Tuticorin, Beypore, Calicut, Karwar, Ratnagiri, Bhavnagar, Veraval, Porbandar, Okha and Bedi.
- (iii) **Third Priority Works (Rs. 42.5 lakhs):** for the ports of Cuddalore, Nagapattinam and Bhavnagar.
- (iv) **Development of All-Weather Deep Draft Ports:** at Tuticorin, (first priority, Rs. 1,027.00 lakhs); Mangalore, (first priority, Rs. 1,270.00 lakhs); Paradeep (second priority, Rs. 954.00 lakhs); Porbandar (second priority, Rs. 525.00 lakhs).
- (v) **Enlargement of the Dredging Pool for External Dredging:**

It was recognized that there was great scope for the improvement and utilization of many of the "Intermediate" and "Minor" ports at a

comparatively small capital outlay. A hydrographic survey of these ports and their approaches, a planned scheme of dredging, provision of modern cargo handling appliances, such as jetties, cranes and tugs or launches, amenities for passengers, etc. would go a long way to satisfy immediate needs.

**Ports and Harbours under the Plans:** The basis of classification of the ports other than "Major" is that those handling not less than 101,600 tonnes (100,000 tons) a year and considered otherwise important are "Intermediate" ports; those handling less than 101,600 tonnes (100,000 tons) but more than 5,080 tonnes (5,000 tons) a year are "Minor" ports; and the rest handling less than 5,080 tonnes (5,000 tons) a year are "Sub Ports".

The large scale programme of economic development of the country initiated with the commencement of the Plans imparted a fresh stimulus to the improvement and expansion of port facilities in the country. Owing to late start, the provision of Rs. 36.91 crores made for ports and harbours during the First Plan could not be utilized fully and only Rs. 27.57 crores were spent. Nevertheless, the programme undertaken was of great importance. The main objectives were to rehabilitate and modernize the facilities in all existing ports, to provide a certain amount of additional capacity at Cochin and Madras by constructing additional wharves and berths, to develop a new major port at Kandla, to construct a new marine oil terminal at Bombay, and to carry out some of the more urgent improvement measures at the important ports. The total capacity of the major ports during the First Plan increased from 20 million tonnes to 25 million tonnes. The developmental programmes, apart from the Kandla port and the township of Gandhi Dham, included the development of the Sonai yard into a central storage depot for ores, a Spur at Akra for training the river Hooghly, and the improvement of the railway yard at Kidderpore; these related to the port at Calcutta. At the Bombay Port, the more important projects were the Marine Oil Terminal Project, the electrification of cranes in the Alexandra Dock, the reconstruction of transit sheds in the Princes and Victoria Docks and the labour-housing scheme.

The Second Five Year Plan aimed at the completion of the projects commenced during the First Plan and the provision of additional berthing capacity at the ports of Calcutta, Madras, Visakhapatnam and Cochin. During the first two years of the Second Plan, there was severe congestion in the ports owing to large scale imports of heavy cargo.

In the Third Plan, along with the completion of the projects already under way in the previous plan, provision was made for the modernization and expansion of the docks in the Bombay Port. The capacity at the end of the Plan was expected to go up from 37 million tonnes to

49 million tonnes. With a view to ensuring the maintenance and preservation of the Calcutta port, two important schemes were later included, namely, (a) the construction of an ancillary port at Haldia, and (b) the construction of a barrage on the river Ganga at Farrakka.

**Ports in the Fourth Five Year Plan:** According to the estimates for the Fourth Plan, the proposal is to expand the capacity of the "Major" ports from about 55 million tonnes in 1968-69 to 77 million tonnes at the end of the Fourth Plan. The total cost of the programme for the development of "Major" ports included in the Central Sector is about Rs. 280 crores.

**Principal Ports and their Plans — (i) Calcutta:** The port of Calcutta is located on the left bank of the river Hooghly 129 km. downstream from the confluence of the Bhagirathi and Bhaireb Jalengi, the two spill channels of the parent river Ganga. The seaward approach to the port is at Sandheads, about 198 km. from Calcutta. Depths of water in the various bars and crossings in the navigable channel from the Sandheads to the port vary continuously, thereby necessitating maintenance dredging throughout the year on an extensive scale. These features, as well as the peculiar tidal conditions obtaining in the river, make pilotage compulsory and impose restrictions on the day-to-day drafts upto which ships entering and leaving the port are permitted to load. Dredging was first undertaken in 1907 and confined at the time to a few bars in the upper reaches. Now it has to be done from the main port area to the mouth of the river. The quantity of silt dredged every year has ranged from 10 to 12 million tonnes. The cost of dredging the Hooghly (including depreciation) has risen from Rs. 57.95 lakhs in 1948-49 to Rs. 350.00 lakhs in 1963-64 and Rs. 381.00 lakhs in 1964-65.

Calcutta port has two dock systems namely, the Kidderpore Docks and King Georges Docks, provided with a number of berths and facilities, such as transit shed, cranes for handling cargoes, including heavy lifts and rail facilities. There are a number of warehouses for storage of goods, dry docks for carrying out repairs to vessels and salvage craft to assist vessels in distress, which are provided by the Calcutta Port Commissioner.

Although the advisability of a subsidiary port nearer the sea than the port of Calcutta had been considered from time to time during the past ninety years, the need for it was felt with a degree of urgency only within the last few years. The deterioration of the river Hooghly, particularly above the Diamond Harbour, and the impracticability of meeting the situation by any modernization or extension of the existing port facilities at Calcutta made it imperative to provide for an alternative dock permitting deeper draft throughout the year and adequate to cope with the

present day tendency towards larger and deeper draft ships, particularly for bulk cargo. The question was examined by a committee appointed by the Government in 1954. Experts selected Haldia in the estuary as the best site for the purpose. About 90 km. downstream from Calcutta, Haldia, under development, is expected to be a supplementary port to Calcutta.

There are two major projects under way; one, the River Training Scheme, undertaken by the Calcutta Port for improving the navigability of the Hooghly, and the other, the Farakka Barrage Project, now in an advanced stage, for obtaining a perennial headwater supply to the Hooghly to remove the siltation of the river.

The traffic of the Calcutta port has declined from 11 million tonnes in 1964-65 to 7.86 million tonnes in 1968-69.

(ii) **Bombay** — The first enclosed dry dock at Bombay was constructed in 1875; the Princes Dock and the Victoria Dock were constructed in 1880 and 1888, respectively. In 1891 the Merewether Dry Dock was added. In 1914 the Alexandra Dock and the Hughes Dry Dock were constructed. Other facilities kept pace with these developments, such as the provision of transit sheds, warehouses, installation of cranes, bulk oil depots, the establishment of a Port Trust Railway and large depots for cotton, grain and other products.

Along the harbour front, there are a number of bunders or open wharves and basins, where the traffic carried by the coasting and country draft and oversea cargo from the Docks and the stream are handled. The bunders provide an aggregate total quay length of 8150 metres and are equipped with cranes. Transit sheds and warehouses at the port aggregate 308,000 sq. metres of port area. The Ballard Pier with 457 metres of extension of the harbour wall is used for large passenger liners. The marine oil terminal with three berths constructed during the First Five Year Plan was designed to take in large tankers of 30,000 G.R.T. and to handle about 9 million tonnes.

In the Fourth Five Year Plan, it is proposed to start work on two berths at Navah — Shera islands on the eastern side of the harbour as the first phase of development of a satellite port.

(iii) **Madras** — Madras Port is an artificial harbour of about 81 hectares encroaching into sea upto 9 metres contour from low waterline, enclosed with breakwaters and quays on all sides. The ships stay alongside the berths inside this basin or at moorings. The present capacity of the harbour, including moorings and oil berths, is 18 vessels. Owing to heavy swells during monsoon, oil berths outside the harbour are unusable for four months in the year. All the quays are served by a mixed gauge railway.

The first stage of the Wet Dock scheme for new berths and works

designed to counteract the sand menace and facilities for handling an increased volume of cargo taken up during the First Five Year Plan was continued in the Second Plan. During the Third Plan, apart from the the completion of the projects already under way, provision was made for additional ore and coal yards and mechanical equipment for handling iron ore.

During the Annual Plans of 1966-69, a new project, the Madras Outer Harbour Scheme was taken up, which included provision for an ore-cum-oil dock. This will also cater to deep draft tankers, and ore carriers.

(iv) **Cochin** — Built in a fine natural harbour, giving access to about 201 sq. km. of navigable breakwaters, Cochin port affords even in the worst monsoon weather accommodation for vessels which can lie comfortably in the harbour and carry on landing and shipping operations without interruption. The main wharf of the port is in the Willingdon Island, 316 hectares created by reclamation. It has 16 stream berths, one being a swinging berth, capable of taking vessels upto 198 metres in length and 9.14 metres in draft. There are also three tanker berths. Cargo is landed and shipped into stream moorings by lighters, oil being handled by barges. The deep water wharf, 671 metres long, could accommodate four 137 metres vessels at a time. A small dry dock, 73 metres by 13.4 metres, is used to dock dredgers and other craft belonging to the port.

During the First Plan a new coal berth and an oil jetty were completed while construction of four additional wharf berths was in progress. During the Second Plan, provision was made for a coal berth, a berth at Fort Cochin, and the completion of four additional wharves. The programme during the Third Plan was mainly one of completion of the projects in progress and additional ore and coal yards and mechanical equipment for handling iron ore.

During the Fourth Plan, the development schemes relate to the construction of an open berth and the acquisition of equipment, such as grab dredger, tugs, water sarge, cranes, fork lifts and tractors.

(v) **Visakhapatnam** — There being no major port on the 1,449 km. long stretch between Madras and Calcutta, the need was felt even as early as the beginning of the century for providing another major port at Visakhapatnam, 784 km. north of Madras, which had the best natural facilities for development. Although sanctioned by the Secretary of State in 1909, it was postponed owing to difficulties of funds and the First World War. Construction was actually started in 1925 and after considerable dredging and reclamation work, a comparatively unimportant calling place was eventually converted into a major harbour with quay

berths, sheds and port facilities in 1933. The port was open to ocean going vessels in 1933; the Raipur — Vizianagaram Railway had also been opened by then.

The hinterland of the port comprises Andhra Pradesh, Madhya Pradesh, and Orissa—a region rich in agricultural produce, such as rice, tobacco, sugar, molasses, jute and ground-nut, and mineral ores like manganese and iron. Industries have also come up fast. Besides the shipyard and the oil refinery in the port area, there are several jute mills, sugar mills, paper mills as well as ferro-manganese, chemical and fertilizer factories in the adjacent area. The port also serves the Bhilai and Rourkela steel mills and other industries in their neighbourhood.

The port can accommodate 17 vessels at a time. There are four quay berths on the eastern side of the northern arm for accommodating four ocean going vessels at a time; two oil refinery berths for berthing two oil tankers on the northern side of the western arm, and three jetty berths which can accommodate three ships. There are also two deep dredged berths of 480 metres for ore-carriers with a mechanical iron-ore handling plant capable of loading 2,666 tonnes per hour.

A final investment decision taken on the Visakhapatnam Outer Harbour Project, estimated to cost Rs. 37 crores, has led to action being taken. The Outer Harbour is scheduled to be ready for receiving ships by 1974.

(vi) Tuticorin — As a port with maritime trade, Tuticorin Port is much older than Madras, having been in existence with a flourishing trade in pearl fisheries from the time of the Pandyan Kings. It is the largest commercial town on the west side of the Gulf of Mannar. The port is an open roadstead, the anchorage being roughly 8 km. off shore, which renders loading and unloading operations extremely difficult at times of high seas and gales. The port is open throughout the year.

A project called Sethusamudram Project has been proposed, connecting the Gulf of Mannar and the Palk Bay by cutting a channel at the approaches of the Adam's Bridge enabling deep sea ships to navigate entirely in Indian territorial waters in safety from the west to the east of India. This will also result in saving shipping mileage equivalent to a day's sailing. It has been decided to carry out a complete and comprehensive investigation under the supervision of an experienced harbour expert to prepare a realistic estimate and a proper economic assessment of this project.

The conversion of Tuticorin into a "Major Port" has been taken in hand by the Government of India at a cost estimated at Rs. 24.50 crores. The project, with two break waters, 4,000 metres and 1,275 metres, to form a basin to accommodate six berths, is expected to be completed by the end of the Fourth Five Year Plan.

(vii) **Marmagao** — Prior to the liberation of Goa in 1962, the port of Marmagao was part of the Portuguese possessions in India.

Marmagao has great natural advantages. It is capable of berthing large steamers. The port has a quay, 925 metres long, protected by the breakwater (515 metres) and a mole (265 metres). To the north and east of the harbour shore is a large roadstead which can accommodate 50 or more ships in fair weather. During the monsoon, there are sheltered anchorages for 15 ships only. The principal commodity handled by the port is low grade iron ore, which accounts for 95 per cent of the traffic.

There is a mechanical ore handling plant with an annual turnover of about 1.5 million tonnes. The installation of modern handling facilities has been started. The development plans include the increase of capacity of the port to 10/12 million tons of iron ore, made up of the local as well as Ballary-Hospet ore, about 2 million tonnes of general (dry) cargo, and possibly some more additional capacity to take in coal for a steel plant, if it materializes.

(viii) **Mangalore** — The development of Mangalore from a lighterage into a "Major Port" was included in the Third Five Year Plan. The cost, as at present estimated, is about Rs. 22 crores.

The new harbour will be located at Panambur, north of the Gurpur river. The construction of the railway link from Mangalore railway station to the harbour is in progress. The entire project is expected to be completed during the Fourth Plan period.

(ix) **Paradeep** — The port of Paradeep, declared a "Major Port" on April 18, 1966, was developed at first by the State Government of Orissa in November 1962. The first stage of the construction consisted of dredging the lagoon with an approach channel from waves and siltation and an iron ore berth which can accommodate 61,000-tonne ore carriers. The project was taken over by the Central Government with effect from June 1, 1965. The first stage of development of the port to enable it to handle two million tonnes of iron ore was completed and export of iron ore was commenced on November 20, 1966.

The ore-berth is equipped with an ore handling plant designed to load 2,500 tonnes of iron ore per hour. The express way from Daitari to Paradeep has been completed. The only means of communication to the port is road transport which can move 250,000 tonnes a month. The Cuttack — Paradeep rail link is expected to be ready by 1971-72. This will facilitate the handling of increased general cargo. Paradeep is the nearest deep sea port for the export of iron ore and other minerals from the mineral belt in the Bengal — Bihar — Orissa area. Its main problem has been the maintenance of the dredged depth of 12.8 metres.

The traffic of the major ports for select years during 1950-51 to 1968-69 is shown in the Table below:

TABLE XXI  
Traffic of Major Ports, 1950-69 (select years)

| (Tonnes in Millions)     |                   |                   |                 |                         |                  |

**VII. Air Transport**

The first aeroplane flight in India was in January 1911. In February of that year the first ever carriage of mails in the annals of world aviation history was done by a French pilot who flew across the Yamuna, from Allahabad to Naini, a distance of 9.66 km. and delivered official mail.

The earliest references to civil aviation in India are contained in the Indian Aircraft Act 1911 and the Indian Airship Rules 1913. The first proposal to use aviation for commercial purposes was made by G. R. Clark, Director-General of Posts and Telegraphs, in August 1919, suggesting the starting of a service for the carriage of mails. In the same year the Indian Aircraft Rules were framed which were to come into effect in 1921. On September 21, 1919, the constitution of an advisory body, the Air Board, was approved and, on March 5, 1920, a Chief Inspector to the Air Board was appointed. On January 22, 1920 a weekly air mail service between Karachi and Bombay was operated by the R.A.F., but this was discontinued after five weeks.

There were hardly any developments in the succeeding years. In

May 1926, the Air Board called attention to the fact that India was admirably suited for the development of aerial transport, the meteorological conditions being excellent for many months of the year and there being no reason to believe that the difficulties occasioned by the monsoon, although serious, were insurmountable. Apart from the question of internal services, India's geographical position marked her out as an all important link in any air route between Europe and the Far East.

Scheduled civil air transport first came to India in the international field when, in 1929-30 the British, the French and the Dutch extended their respective Empire air services to and across India. The plans for an Indian State-operated service between Karachi and Calcutta had to be shelved because of the adverse financial position of the Government, resulting from the effects of the economic depression, and instead a charter agreement was made with the Imperial Airways Ltd. to operate a service between Karachi and Delhi. As this arrangement was found unsatisfactory from the point of view of the Government of India, it was given up in the middle of 1932, the Delhi Flying Club continuing the services to the end of the year for the carriage of mails only.

When the British Government extended their Empire services to Singapore, arrangements were made for Indian participation through the medium of an Indian company, the Indian Transcontinental Airways, in which the Government took a shareholding of 24 per cent. Not only was this arrangement financially unprofitable because of the fact that all managerial and operational responsibilities were with the Imperial Airways, but it afforded hardly any scope for Indian initiative or experience.

The credit of taking the first really effective step in the operation of internal air services in India goes to the Tata Sons Ltd. who, with two light-engined craft, organized, in October 1932, an air service from Karachi to Madras, on a frequency of one service a week with calls at Ahmadabad, Bombay and Bellary (later changed to Hyderabad). In May 1933, another company, the Indian National Airways, was formed with headquarters at Delhi and, in December 1934, it established an air service between Karachi and Lahore, linking with the Imperial Airways Service at Karachi. The main source of revenue for these services was the air mail contract with the Government for the carriage of mails by air, the rate of remuneration being covered by the air surcharge collected by the Posts and Telegraphs Department. The surcharged air mail revenue was not insubstantial as it included also the incoming overseas airmails to destinations in India. These airlines were given free air route organization and they operated with almost exiguous ground organization with little or no communications or navigational facilities.

By 1934, the Tata Sons doubled their weekly frequency on the Karachi-Madras route, and in 1935 they started a weekly service between Bombay

and Trivandrum with halts at Goa and Cannanore. In 1937 a bi-weekly service was run between Bombay and Delhi via Indore, Bhopal, and Gwalior. All these services were operated during the fair season only as the ground organization was unsuitable during the monsoon.

**The Empire Mail Scheme, 1938:** In connection with the introduction of the Empire Mail Scheme in 1938 it was decided to carry by air the whole of the letter mail between the Empire countries on the U.K.-Australia and the U.K.-Africa routes. The Government of India, in agreement with the Government of Ceylon (Sri Lanka) agreed to participate in the scheme, which, among other things, involved the provision of facilities for distribution within India of the Empire mail carried by the Imperial Airways to Karachi and taking in the reverse direction to Karachi all Indian mail destined for the Empire countries. The Government utilized for this purpose the existing services of the Tata Sons and the Indian National Airways, and entered into 15-year contracts with them for the carriage of mail on their routes under the Empire Mail Scheme.

The main points in the contracts were that (a) the Karachi-Madras route was to be extended to Colombo under arrangements with the Government of Ceylon (b) the services were to be operated with the same frequency as the Imperial Airways Service to Karachi, which was expected to be five times a week and connecting with it; and (c) the remuneration would be: (i) in regard to the Tata Sons a guaranteed payment of Rs. 15 lakhs a year for the carriage of mails on the Karachi-Colombo route upto 500,000 lbs. (2,26,800 kg.) plus Re. 1/- for each lb. (0.45 kg.) of mail extra, and (ii) in regard to the Indian National Airways a guaranteed payment of Rs. 3.25 lakhs a year for the carriage of mail on the Karachi-Lahore route upto 130,000 lbs. (58,970 kg.) plus Re. 1/- for each lb. (0.45 kg.) of mail extra. The Government of Ceylon agreed to share the payment to Tata Sons to the extent of Rs. 4.5 lakhs per annum in regard to the conveyance of the mails on their account. These mail contracts included an element of financial assistance by Government intended to put companies on such a basis as to place their development on a reasonably secure position.

The operations on the two services commenced in February 1938. Quite apart from their helping to bring about a shift to larger aircraft and greater frequency, the services afforded the opportunity for the proper development of passenger and freight traffic by air in the country. Tiruchchirappali was added to the halts on the Karachi-Colombo route and, by October, the frequency was raised to five times a week by both the companies. The Indian National Airways also opened service, with a frequency of three times a week between Lahore and Delhi.

An experiment of cheap fare and high frequency was attempted, during 1937-39, by a third company, the Air Services of India, which,

during the fair weather season, operated air services from Bombay to a number of Kathiawar States and to Kolhapur six times a week. The high loads of passengers in these services demonstrated the convenience and advantage of air travel. The low fares, slightly above the second class rail fare, were less than the minimum costs of operation; these services had consequently to be closed down in 1939.

**Progress of Air Traffic upto 1938:** The progress of air transportation by 1938 is indicated by a few figures. In that year 8,353 km. of route were operated, the total kilometres flown exceeded 2.14 million, and the percentage regularity was 99.8. The volume of traffic carried on the different routes was as follows:

TABLE XXII  
Volume of Traffic Carried by the Airlines, 1918

|                  | <i>Passengers carried</i> | <i>Mails carried<br/>(lbs.)</i> | <i>Freight carried<br/>(lbs.)</i> |
|------------------|---------------------------|---------------------------------|-----------------------------------|
| Karachi-Colombo  | 514                       | 430,000                         | 11,845                            |
| Karachi-Lahore   | 93                        | 117,270                         | 68                                |
| Bombay-Kathiawar | 2,175                     | 1,330                           | 89,196                            |

The development of air transport since 1932 proved that Indian airlines could organize and operate services efficiently on long and difficult routes and maintain a very high standard of regularity and safety as compared with most of the advanced countries. In the meantime, the Government extended and strengthened the ground organization, providing aerodromes, hangars, workshops, technical and administrative buildings, air route lighting, the training of "B" Licence pilots, etc. The pioneering companies had helped to lay firm foundations of scheduled air transport in the country.

**War-Time Developments:** The steady progress of civil aviation in India was suddenly interrupted by the outbreak of World War II. The Empire Mails Scheme had to be suspended, as the resources of the Empire air services had to be diverted to the requirements of defence. Likewise, the air transport services in India were put on a war footing and run for the Government and the Defence Services. Although initially curtailed, the two companies, in collaboration with the Royal Air Force Transport Command, operated services for the Government in different areas with increasing intensities for the carriage of freight, military personnel, mails and civil priority passengers. In the later stages, these companies obtained Lease-Lend aircraft consisting of Expeditors, D.C. 2's and D.C. 3's.

The routes operated during war-time were as follows:

Karachi-Colombo

Bombay-Delhi  
 Bombay-Calcutta  
 Bombay-Coimbatore  
 Bombay-Karachi  
 Bombay-Colombo  
 Delhi-Karachi  
 Calcutta-Dinjan  
 Calcutta-Jorhat  
 Calcutta-Gaya-Allahabad-Kanpur-Delhi  
 Delhi-Bhopal-Hyderabad-Bangalore-Tiruchchirappalli-Colombo  
 Delhi-Ahmadabad-Bombay  
 Delhi-Karachi  
 Lahore-Multan-Jacobabad-Karachi  
 Lahore-Gujarat-Rawalpindi-Peshawar  
 Lahore-Jacobabad-Quetta

War-time activities afforded the Indian airlines valuable experience in important items of special work, such as the survey of the Southern Arabian air route for the R.A.F., carriage of ammunition and supplies to Iraq, evacuation of civilian refugees from Burma, servicing, overhaul and maintenance of R.A.F. aircraft in their workshops, and opportunities to handle more modern aircraft and train and employ a good number of technical personnel. When the war ended, the companies equipped themselves with Dakotas purchased from the U.S. Foreign Liquidation Commission prior to the Government of India taking over the disposal stocks.

The striking increase in the volume of air traffic since 1939 may be seen from the Table below:

TABLE XXIII  
Volume of Air Traffic during 1939-1945

| <i>Year</i> | <i>Km. flown (00s)</i> | <i>Passengers</i> | <i>Freight in lbs.</i> | <i>Mail in lbs.</i> |
|-------------|------------------------|-------------------|------------------------|---------------------|
| 1939        | 2,714                  | 3,518             | 98,449                 | 436,883             |
| 1940        | 2,181                  | 3,646             | 48,852                 | 118,101             |
| 1941        | 2,080                  | 3,747             | 39,511                 | 142,132             |
| 1942        | 2,606                  | 4,659             | 163,242                | 342,921             |
| 1943        | 3,100                  | 7,574             | 642,885                | 412,580             |
| 1944        | 3,413                  | 13,433            | 1,163,725              | 370,659             |
| 1945        | 3,343                  | 24,090            | 852,068                | 480,616             |

**Post-War Developments:** Before the war ended, the Government of India sought to lay down the future policy towards the development of air transport in the country. The policy outlined prior to the war was too limited in perspective and actual needs. India had adhered to the International Convention for the Regulation of Air Navigation signed in Paris in 1919, according to which she undertook, along with the other countries, to give certain general privileges to the aircraft of

the ratifying States and to secure uniform practice in such matters as traffic rules and standards for licensing pilots and aircraft

In 1926, the Indian Air Board recommended, among others, that (a) all landing grounds in India and their necessary equipment should be the property of the Government of India who should be responsible for the provision of wireless and meteorological facilities; (b) the Government should claim in future to be consulted at all stages on the terms of any contract for an external air service touching India and to participate as a principal in any such contract for an external air service touching India; and, (c) as far as internal air services are concerned, Government should accept the principle of subsidizing such services in the earlier years. The Government of India accepted these recommendations. The really important and comprehensive statement of policy on the subject was made in the papers considered and approved by the Reconstruction (Policy) Committee for Posts and Aviation, in 1944.

"The policy of the Government of India is to permit the development and operation of air transport services, internal and external, by a limited number of sound and reliable private commercial organizations with their own capital and operated under normal commercial principles of risk of losses and prospects of gain. The operation of air transport services would be subjected to licences granted by Government. Without such licence no air transport service can operate. The grant of State assistance in specific cases will be entirely at the discretion of Government and on conditions to be laid down in each case. In specific cases, Government should take a financial interest in the Companies operating air services and appoint a Director on the Board. The Government should not, however, take a controlling share in such cases."

The Indian Aircraft Act and Rules were amended in March 1944 to license air transport undertakings and to prohibit all operations of air transport without a licence. The rules framed thereunder provided that, after October 1, 1946, no air transport service should be established in India except under the authority of, and in accordance with, the licence issued by an Air Transport Licensing Board. In granting the licence the Board was to take into account (a) the proper development of air transport services in accordance with the needs of the public, (b) the potential traffic on particular routes, and (c) the adequacy or otherwise of the financial and technical resources of the applicant for satisfactory operation of air transport. The Board was given power to prescribe the limits within which the passenger fares, freight rates and mail carriage rates could be fixed. The rules also required the submission to the Board by the operating companies of operational and financial returns showing their operational costs and traffic carried.

Before the new arrangements could come into effect, two more companies for the operation of air services came into existence, namely, the Air Services of India, acquired and resuscitated by the Scindia Steam Navigation Company, and the Deccan Airways Ltd., in which the Hyderabad Government held a majority interest. Meanwhile, the Tata Sons converted its Aviation Department into a public limited company, the Air India, on July, 29, 1946. There were thus four companies which, on July, 1, 1946, operated the following routes:

- (1) Tata Sons Ltd./Air India:
  - (i) Karachi-Ahmadabad-Bombay-Hyderabad-Madras-Colombo.
  - (ii) Bombay-Ahmadabad-Delhi
  - (iii) Bombay-Nagpur-Calcutta
- (2) Indian National Airways:
  - (i) Calcutta-Allahabad-Kanpur-Delhi-Lahore-Rawalpindi-Peshawar
  - (ii) Lahore-Bikaner-Jodhpur-Ahmadabad
  - (iii) Delhi-Jodhpur-Karachi
  - (iv) Delhi-Lucknow
  - (v) Karachi-Quetta-Lahore
  - (vi) Delhi-Gwalior-Nagpur-Hyderabad-Madras (operation of service discontinued July, 29, 1946)
- (3) Air Services of India:
  - (i) Bombay-Jamnagar-Bhuj-Karachi
  - (ii) Bombay-Bhopal-Kanpur-Lucknow
- (4) Deccan Airways:
  - (i) Madras-Hyderabad-Nagpur-Bhopal-Gwalior-Delhi
  - (ii) Hyderabad-Bangalore.

Soon after October 1, 1946, some more companies were floated for the operation of air services. By the beginning of 1947, there were 21 companies registered with an authorized capital of Rs 42 crores, of which Government had permitted the issue of Rs. 9 crores. Only seven of these new companies eventually obtained licences, namely,

- (1) Mistri Airways (later Indian Overseas Airlines January 1946/September 1946).
- (2) Bharat Airways, August 1945/June 1947.
- (3) Airways (India), September 1945/April 1947.
- (4) Orient Airways, June 1947 (Chittagong-Rangoon).
- (5) Ambika Airlines (Kathiawar Area).
- (6) Jupiter Airways (Madras-Delhi via Bezwada).
- (7) Dalmia Jain Airways (Delhi-Srinagar).

These companies had acquired 115 Dakotas as against the requirements of only 40 such machines to operate the air services mentioned in

the post-war Plan. There ensued severe competition among the companies for the extremely limited number of technical personnel available in the country, thereby raising their wages and salaries to very high levels. A comparatively large number of aircraft and too little business, however, came in quite handy for meeting emergency situations which came in quick succession.

The traffic and finances of the airlines were adversely affected by certain other developments. The abandonment of the Empire Air Mail Scheme and the partition, as a result of which both the Air India and the Indian National Airways lost the mails traffic originating in Pakistan, and the desire of the Government of Sri Lanka to contract out of the agreement necessitated a revision of the Government's financial arrangements with the two companies. It was decided to let the Government of Sri Lanka to discontinue the payment of Rs. 4.5 lakhs per annum and to reduce the minimum guarantee of remuneration to the Air India to Rs. 10 lakhs and to the Indian National Airways to Rs. 1 lakh per annum.

Air transport played an important part in the situation created by the refugee migrations which arose in East and West Bengal in 1949 and the carriage of an unprecedented volume of traffic between West Bengal and Assam/Tripura owing to the cutting off of the surface routes between these areas. The three regular operators in the area — the Airways (India), the Bharat Airways and the Kalinga Airlines — stepped up the frequency of their scheduled services and, as these did not meet the actual demands, scheduled operators based at other centres and a large number of non-scheduled operators also came into the field. The situation gave rise to such undesirable practices as rate-cutting to uneconomically low levels, drift of operating personnel and other technical staff from company to company, crews working for excessive hours, overloading of aircraft, influx of middlemen as touts for canvassing traffic, etc. The Director-General of Civil Aviation tried to bring some sort of order in the situation and the acceptance of an agreed code of operating practices. The pressure of traffic continued till March 1949 after which the position eased. With the onset of the monsoon and the washing away of the Assam Rail Link, the demand for air transport again revived. It was quite clear that air transport would always have an important part to play in the system of communications in this part of India.

To the financial difficulties of the airlines already referred to were added in 1949 the increase in expenditure on account of the rise in the price of aviation fuel and in staff costs. The Government afforded relief to the companies by the grant of a rebate of import duty, on petrol used in civil aviation, of 6 annas per gallon (37.5 paise per 4.5 litres) as

from mails was fixed at March 1, 1949, later increased to 9 annas (56 paisas.) The payment for the carriage of mails was fixed at freight rate plus 25 per cent instead of the Rs. 1-8-0 per lb. (Rs. 1.5 per 0.45 kg.) before the "All-Up" Mail Scheme, without the air mail surcharge, was also introduced with a view to affording the air companies the benefits of increased mails traffic and consequently of increased revenues.

During the latter part of 1948, the Government of India had under consideration the possibility of a scheme of carrying by night all the mails passing between the four main cities of India, namely, Calcutta, Bombay, Delhi and Madras. The operation envisaged night services on the Delhi-Nagpur-Madras and Bombay-Nagpur-Calcutta routes with four aircraft starting more or less simultaneously from Delhi, Madras, Bombay and Calcutta, in the early part of the night, meeting at Nagpur for exchanging the mails and returning to their respective starting stations the next morning. The mails posted at each of the stations till the evening would reach the destinations the following morning. Only the Indian Overseas Airlines, among the several air companies, offered to work the scheme without a guarantee of minimum payment or load or any higher rate of remuneration for carriage of mails than that already in force. The scheme was initially restricted to the carriage of mail and freight only, as night air mail operation was considered to be on an experimental basis and as the routes were not fully equipped from the point of view of passenger safety. The licence which was granted for one month from January 31, 1949, was later extended to the end of June 1949. The air mail carried upto March 31, 1949, was surcharged mail, and amounted to 48,000 lbs. (21,772 kg.) per month. With the introduction of the "All-Up" Mail Scheme, the volume of mails carried by the Indian Overseas Airlines more than trebled itself.

The day air mail services continued to carry mail posted after the departure of the night services. The scheme was unfortunately brought to an unexpected termination by the middle of 1949, as the Indian Overseas Airlines got into serious financial difficulties and had to discontinue its Madras-Delhi service on May 19, 1949 and the Calcutta-Bombay service on June 8, 1949. The night services were, however, kept in operation by the Deccan Airways between Madras and Nagpur and the Indian National Airways between Delhi and Nagpur under special terms. With the onset of the monsoon, the night services were terminated as the organization in existence was considered inadequate for operation during monsoon.

The Government's intention was to resume the night air mail services in October but practically none of the scheduled airlines was prepared to operate the services without a guarantee. The Himalayan Aviation, then a non-scheduled operator which offered to operate without a

guarantee, was given the licence by the Director-General of Civil Aviation for a period of three months as from October 31, 1949. As by then the ground facilities, the communications organization and the navigational aids on the Delhi-Nagpur-Madras and Bombay-Nagpur-Calcutta routes had been brought to such standards that carriage of passengers by night was considered safe, the Himalayan Aviation was also permitted to carry passengers on the night services.

**Air Transport Enquiry Committee:** The wisdom of admitting an additional operator into the field of scheduled air transport and giving it the bulk of the mail traffic was questioned by the existing scheduled airlines whose financial difficulties were aggravated by rising expenditure and want of adequate traffic. The fact that the Himalayan Airways was allowed to carry passengers on the night services at lower rates (112 per cent of First class rail fares) was also cited as another factor operating adversely on their own passenger revenues, and the situation called for a detailed enquiry into the air transport industry. As the Government felt that all was not well with the air transport industry, it appointed on February 8, 1950, the Air Transport Enquiry Committee with Justice G. S. Rajadhyaksha as Chairman. The committee examined the conditions of the various airline companies and found that there was a good case for air transport service being owned and operated by the State on the ground that a unit incharge of all operations could use the available resources to maximum advantage, that operations by a State organization would be an advantage from the point of view of Defence; that State management would tend to give better and cheaper service to the public; that a unified organization could take full advantage of technical development in air transport equipment and operational technique, and that, as the private airlines would require financial assistance from the Government to be placed on their feet, it would be preferable for the Government itself to run it in its own way. But in view of the complete changeover that nationalization would involve and the difficulties in getting the personnel with business and administrative experience, the committee recommended a scheme of reorganization with a view to rationalization. An ideal pattern would be to have four operators with bases at Bombay, Delhi, Calcutta and Hyderabad. As this was not feasible, the committee suggested the merger of the airline companies operating in the same area, such as the Bharat Airways, Airways (India) and Kalinga Airways and the Air Services of India and the Deccan Airways. As regards the subsidy to the industry, the recommendation was that it should be based on a 'quality standard cost' announced by the Government according to which any airline having revenues less than the standard would get a subsidy amounting to this deficit, while in the event of the cost of operation being less than the standard costs, 50 per

cent of the difference would be paid to the airline as bonus. The ceiling of the subsidy was 8 annas per gallon (50 *paisa* per 4.5 litres) of fuel consumed by the company. On representations from the Air Transport Association of India, Government decided to postpone the introduction of the new scheme of subsidy from October 1, 1950 to January 1, 1952.

**Nationalization:** The conditions in the air transport industry were disclosed to be such that, if it was to remain privately managed, substantial financial assistance from Government would be required for the replacement of the fleet, which had become long overdue. The industry was largely dependent on the Dakotas which had been released to operators after the war at very low prices. Their replacement would, therefore, mean a considerable financial outlay with no comparison whatever to the earlier investment. The Government, therefore, decided that, as considerable State assistance was inevitable, it was better to nationalize air transport. Following this decision, the Air Corporation Act was passed and received the President's assent on May 28, 1953.

In accordance with the Act, the undertakings of the Indian Air Companies operating scheduled services were taken over by two State Corporations, namely, the Air India International and the Indian Airlines, after payment of compensation as provided for in the Act. The Air India International took over the undertakings of the Air India International Ltd. The Indian Airlines Corporation acquired the following companies:

- (1) Air India Ltd.
- (2) Air Services of India Ltd.
- (3) Airways (India) Ltd.
- (4) Bharat Airways Ltd.
- (5) Deccan Airways Ltd.
- (6) Himalayan Aviation Ltd.
- (7) Indian National Airways Ltd.
- (8) Kalinga Airlines.

The Air India International was intended to operate a long distance international service, while the Indian Airlines Corporation was to operate the internal scheduled services and the air services to the neighbouring countries. The two corporations came into formal existence on June 15, 1953. On August 1, 1953 the Air India International took over, as a going concern, the assets and business of the Air India International Ltd. All the other air transport companies operating scheduled services in India were vested in the Indian Airlines Corporation. In accordance with the Act the companies were to be paid compensation partly in cash but mostly in the form of 5-year Bonds, bearing interest at 3.5 per cent per annum and guaranteed by the Government of India.

**Indian Airlines Corporation:** The Indian Airlines inherited a fleet of 99. The effective strength of the fleet on March 31, 1954, was 87, namely, 3 Skymasters, 12 Vikings and 72 Dakotas. The first year following nationalization was one of exceptional difficulty owing to pressing problems of integration. The route pattern inherited by the corporation was revised with a view to eliminating wastage and meeting public convenience. This resulted in slightly higher utilization, specially in the case of the Dakotas. There was all-round improvement under every head of operation during 1954-55.

During the following years, the Indian Airlines Corporation followed a policy of a changing over to larger and faster aircraft. Dakota operation in India was not economical owing to its limited capacity, slow speed, scarcity of spare parts and high fuel costs. The replacement of the Dakotas by more efficient and modern aircraft had thus become necessary on grounds of both economy and efficient operation. In 1955, three more Skymasters were acquired for operating the night air mail services and orders were placed for eight Herons, which, however, were found later to be unsuitable. During 1957-58, the Viscounts — turbo-prop aircraft — were introduced on the trunk routes, offering greater comfort and convenience to the public. By 1958-59, 10 Viscounts had been placed in service. During 1961-62 five Friendship aircraft were added to the fleet and, in the following year, another five were also obtained in order to replace Dakota operation on the regional routes. The progress towards modernization reached a further stage with the introduction of the Caravelle Jets to take over important trunk routes from the Viscounts. The Caravelles are expected to do better than the Viscounts because of their passenger appeal and productivity. The Air India International has also loaned its surplus Boeing capacity on a regular and continuous arrangement. The remarkable change in the composition of the fleet of the Indian Airlines since nationalization is shown in Table XXIV. A gradual reduction in the number of aircraft has come about as a result of the switch-over to larger aircraft.

There has been steady progress in both the earnings and the volume of traffic carried in domestic air transportation. Taking the figures of the first complete year after the corporation took over, the capacity provided in terms of available tonne-kilometres increased from 76 million to 208 million in 1968-69. During this period, revenue tonne-kilometres rose from 52.96 million to 153 million. The number of passengers increased from 478,000 to 1.89 million. The weight of mails carried advanced from 4,732 tonnes to 10,206 tonnes. The cargo traffic, however, recorded a drop from 51,014 tonnes to 23,102 tonnes.

The financial figures are even more striking. The capital increased from Rs. 5.07 crores, standing at Rs. 25.95 crores at the end of 1968-69. The capital employed during 1959-60 to 1968-69 went up from Rs. 13

\*Grounded Fleet

\*\*Operating Nil

crores to Rs. 46 crores. The operating revenues stood at Rs. 40.12 crores, as against Rs. 6.92 crores in 1954-55. Operating expenses also increased correspondingly from Rs. 7.73 crores to Rs. 36.55 crores.

The working results of the Indian Airlines Corporation closed with deficits in the first five years, aggregating Rs. 4.75 crores. During the next five years the total surpluses amounted to Rs. 1.49 crores only. Although this covers only about a third of the earlier losses, the gains have been progressive, increasing from Rs. 3 lakhs in 1959-60 to Rs. 3.57 lakhs in 1968-69.

The number of employees of the corporation went up from 9,324 to 15,597 in 1965-66.

On September 19, 1955, the Air Transport Council, constituted under the Air Corporations Act 1953, was requested by the Government "to study the general problem of fares and freight rates to be charged on the air services operated by the Indian Airlines Corporation and to draw up for consideration of the Government a set of principles on the basis of which such fares and freight rates should be determined." The council undertook a comprehensive study of all aspects of the problem. It submitted its report on May 1957. In line with the recommendations of the council, the rationalization of the corporation's out-moded air fares was carried out.

The cost structure of the Indian Airlines Corporation was the subject of another enquiry in 1959 by a committee with Sir Stephen Wheatcroft as Chairman to see whether the corporation's system of planning, operation and cost control were as efficient as could be and to determine a formula for working out "standard costs" of operation

on the basis of which the losses of the corporation might be subsidized. While the committee found that the work of the Indian Airlines Corporation was generally that of an airline which operated an efficient network of air services, it had not yet adequately developed systems of commercial control which were essential for a large-scale business. The basis for ascertaining "standard costs" was also indicated.

**Air India Internationals:** The credit for taking the first effective step towards operating external air services goes to Air India, which proposed in 1947 to form a new company called Air India International for the establishment of an air service between India and the U.K. Air India International was registered on March 8, 1948, with an authorized capital of Rs. 7 crores and a paid-up capital of Rs. 2 crores. The Government subscribed 49 per cent, Air India 10 per cent and the public the balance. The company's service from Bombay to London *via* Paris and Geneva was inaugurated on June 8, 1948, with an initial frequency of one service a week, which was later increased to three services a week. A weekly service was started in 1950 between Bombay and Nairobi *via* Aden.

Since nationalization, the Air India has maintained a steady rate of growth in capacity and the number of places served. From a total of three stations served in June 1948, Air India International has increased the number to 30 cities covering five continents over an unduplicated route system of 927,400 km.

In January 1954, Lockheed Super Constellations were introduced for the first time on Air India's route. In 1956, Air India decided to replace its fleet of Super Constellations with jets. It was the first Airline in the world to have an all jet fleet. The Boeing engine base was located at Santa Cruz, Bombay.

The financial and operating statistics of Indian Airlines and Air India since nationalization are shown in the Tables XXV--XXX.

**Non-Scheduled Operators:** In addition to the scheduled operators, there are non-scheduled operators as well as charters permitted by the rules under a permit given by the Director-General of Civil Aviation. As the non-scheduled operators tend to have only the minimum number of aircraft, crew and engineering personnel, the grant of permits is subject to the Director-General satisfying himself as to the minimum requirements from the point of view of safety, operations and maintenance. There were on March 31, 1950 eight non-scheduled operators; ten scheduled operators also held permits to engage in non-scheduled operations. As at the end of 1969-70, the private airlines engaged in non-scheduled operations were (1) The Air Survey Company of India, (2) Bharat Commerce and Industries Ltd., Bombay, (3) Airways India Ltd.,

Calcutta, (4) Jamair Company (P) Ltd., Calcutta, (5) Kalinga Airlines (P) Ltd., Calcutta, (6) Kasturi & Sons, (7) Cambata Aviation (P) Ltd., (8) Balaji Agencies, and (9) H. S. Sobha Singh and Sons.

**Civil Aviation Department:** The Civil Aviation Department under the Director-General is responsible for the provision and development of civil aviation facilities in the country. In particular, it is responsible for providing the following facilities: (a) aerodromes, aeronautical communication and visual and radio aids to navigation and other facilities required by the civil aircraft; (b) inspection and registration of licensing of aircraft and aircraft personnel; (c) training in flying, air traffic control, aeronautical communications, etc.; (d) promotion of aeronautical research and development; (e) formulation and enforcement of civil aviation regulations; and (f) type certification of civil aviation aircraft and aeronautical equipment, aircraft design, and airworthiness requirements.

**Aerodromes:** Prior to partition, there were under the Director-General of Civil Aviation 61 aerodromes, four of which were International, seven Intermediate and 32 Minor. The only airport of entry to India from the West prior to August 15, 1947, was Karachi. After partition, Bombay was developed to be the main airport from the West, together with Palam, in Delhi. Safdarjang, in Delhi was however, used only for smaller aircraft. At the end of December 1969, 85 aerodromes were being maintained by the Civil Aviation Department. Of these, four, namely, Santa Cruz (Bombay), Dum Dum (Calcutta), Palam (Delhi) and Meenambakkam (Madras) airports are international aerodromes. There are 11 major aerodromes, namely, Agartala, Ahmadabad, Amritsar, Begumpet, Delhi (Safdarjang), Gauhati, Jaipur, Lucknow, Nagpur, Patna and Tiruchchirapalli. The Intermediate airports number 38 and the Minor 32.

In order to cope with the rapidly growing requirements of air transport, considerable progress has been made in the progressive extension of runways, improvements to the terminal buildings at Delhi and Calcutta, turning pad for Boeing 747 at Delhi Airport; and navigational aids, communications facilities, tele-communication services, runway lighting, visual beacons, equipment for ground safety services, radio beacons including the initial development of radar stations, flying control, meteorological services, aeronautical information service, etc.

**Aircraft Manufacture:** Under the pressure of World War II, a beginning was made towards the creation of an aircraft manufacturing industry. The Hindustan Aircraft Ltd., subsidized by the Government, built a modern aircraft factory at Bangalore fully equipped for quantity production of aircraft. It was started in December 1940 by Walchand Hira-

chand in collaboration with the Government of Karnataka. The Government of India shortly thereafter became a member of the company; a year later it took over completely the private holdings. During the first three years, the Hindustan Aircraft built a few Curtiss Hawk fighters, Vuktee bombers and Harlow trainers. The manufacturing programme was suspended with the onset of World War II and the factory turned its attention to overhauling and repairing aircraft to meet the requirements of defence. By the time the war ended, the Hindustan Aircraft had overhauled hundreds of aircraft of different types like cargo planes, light bombers, heavy bombers, flying boats as well as Hero engines.

The manufacturing programme was revived after the war and, in 1946, the Hindustan Aircraft began erecting Tiger Moth Aircraft for the Air Force and the manufacture of Percival Prentice trainer aircraft. It also produced, out of what was left after the war, a number of serviceable aircraft, mostly Dakotas, for the newly formed Indian air transport companies. Its activities in the following years have been in connection with the developmental side of aircraft production and more closely associated with the defence requirements. Of the value of its sales, about two-thirds are under aircraft assembly manufacture and overhaul and servicing; the balance is under rail coaches and, until a few years ago, bus body kits and other jobs.

In August 1963, a new public sector company designated as Aeronautics India Ltd., was formed to manage the three separate factories concerned in the manufacture of the Mig-21 aircraft. In March 1964, it was decided to form a public sector organization by the merger of the Hindustan Aircraft Ltd., Bangalore, with the Aeronautics India Ltd. The merger was completed on October, 1, 1964, and the company was redesignated as Hindustan Aeronautics Ltd. To this was transferred the Aircraft Manufacturing Depot, Kanpur, which was set up in 1959 to undertake manufacture of transport aircraft. Eight of the aircrafts produced by it, namely, HS-748s were already in service with the Indian Airlines in 1968-69.

**Five Year Plans for Civil Aviation:** Between 1947 and the commencement of the First Plan, about Rs. 6.6 crores were spent on works relating to Civil Aviation. During the period of the first two Plans, the expenditure incurred amounted to Rs. 24 crores. The programme in the First Plan aimed at making good the deficiencies in aerodromes, communication facilities, equipment, etc. The Second Plan provided for the development of facilities to meet the growing requirements of domestic and international traffic and the new demand arising from technical advances and from India's obligations under the Convention on International Civil Aviation. In the Third Plan, the outlay on civil air trans-

port was Rs. 49 crores. During 1966-69, the three annual plan periods, the outlay was Rs. 66 crores. With the arrival of the jets, the ground organization and equipment called for new facilities.

The Fourth Five Year Plan provided a total outlay of Rs. 202 crores. This envisaged the improvement of runway terminal and communications facilities at the four international airports of Bombay, Calcutta, Delhi and Madras so as to make them suitable for operation of heavier and larger capacity aircraft like the Boeing 747 (Jumbo) Jets. The development of various airports for domestic services was also contemplated besides the replacement of the Dakotas by larger aircraft.

TABLE XXV  
Financial Statistics of Indian Airlines

(Rs. in lakhs)

| Year    | Capital  | Reserve and Surplus | Total Capital Employed | Gross Block Fixed assets | Net Block |
|---------|----------|---------------------|------------------------|--------------------------|-----------|
| 1954-55 | 5,07.02  | 67.16               | 5,74.18                | 2,33.71                  | ..        |

#### VIII. Postal Services and Telecommunications

**Postal Services:** The history of postal communications in India is, as in most other countries, a process of gradual evolution from the rudimentary system of couriers employed by kings and emperors to keep in touch with their far-flung territories into the present immense network and organization. The earliest evidence of a systematic postal service relates to the time of Chandragupta Maurya (C. 321-297 B.C.), when a system of communications was established between Patliputra, *capital*, and the outlying provinces of the vast empire for despatch of information and confidential reports to the emperor. Pigeons were also used as message carriers. Bankers had their own system for sending *hundis* (bills of exchange) between important centres, which probably was the fore-runner of the *Mahajan Dawk* of the 17th and 18th centuries.

Coming down to the middle of the 14th century, Ibn Batuta found an organized system of couriers established throughout the country, consisting partly of those on horse and partly of those on foot. The former were stationed at a distance of four miles (6.43 km.) from each other and the latter at every mile (1.6 km.). The couriers sat inside sentry boxes at every stage of three miles (4.82 km.). Every courier carried a whip, about two cubits long with small bells suspended at the head. With the mails in one hand and the whip shaking continuously on the other, the ring of the bells would announce the arrival and warn the next courier resting in the sentry box. The arrangement provided an efficient relay system which ensured the speedy despatch of mails. Two centuries later, Sher Shah Suri, during his short reign, 1540-45, improved the system by placing two horse couriers on the road every two miles (3.2 km.) to facilitate the rapid conveyance of Government despatches and for promoting trade and

correspondence. An idea of the extent of the service is afforded by the 2,000-mile (3,219 km.) highway he had constructed from Sonarang in Bengal to the banks of the Indus in the Sind. Akbar is said to have placed on the principal roads two swift horses and some *mewias* (runners) at a distance of every *kos* (16 km.) for the carriage of Government letters and some private correspondence. The couriers covered about 161 km. in a day and night, and a letter from Agra to reach Ahmadabad took five days. Chikka Devaraja Urs of Karnataka, who came to the throne in 1672, introduced a more efficient system, providing a regular post throughout his dominions enabling intelligence to be obtained as well as mails to be carried. This later developed into the Mysore *Anche*, which was found to be "the cheapest postal system in the British Empire — probably in the whole world."

**Postal Services under the East India Company and in the later British Period:** During the regime of the East India Company, the prevailing *dak* system was used for almost a century, with its own paid postal runners. It was only towards the end of the 18th century that the East India Company established its own system which connected the principal towns. The zamindars and landholders along the various routes were required to supply runners against a reduction in rents. Some services were operated under the Postmaster-General since 1774 between Madras and Bombay, Machilipatnam and Madras, Bombay and Calcutta.

It was in 1837 under the provisions of Act XVII of that year that a public post was established and the Government reserved to itself the exclusive right to convey letters on payment in the territories of the East India Company. The Postmasters of the Presidency towns supervised the working of a certain number of provincial post-offices and provided for the conveyance of communications and mails over a few main lines of communications, while Collectors had charge of District Post-Offices and local mail lines. The charges for the conveyance of letters levied in cash and paid in advance varied according to weight and distance. The charge for sending a letter from Calcutta to Bombay was Re. 1 and that from Calcutta to Agra 12 annas per tola (11.66 g.)

On the recommendations of a commission appointed in 1850 to report on the working of the Post-Office, Act XVIII of 1837 was repealed and Act XVII of 1854 was enacted. This Act marks the commencement of the organization of the Indian Post-Office as it had come to function. Under its provisions, the whole department was placed under the control of a Director-General. Postage stamps were now first introduced and rates were fixed for the conveyance of letters irrespective of distance. Act XIV of 1856, replacing the earlier one, was again superseded by Act VI of 1898. This Act conferred extended protection and powers and pro-

vided increased facilities for postal insurance, value payable post and the money order system.

From 1854 to 1869, the lowest rate of inland letter postage was  $\frac{1}{2}$  anna for  $\frac{1}{2}$  tola; the next charge was 1 anna for  $\frac{1}{2}$  tola; and for weights above  $\frac{1}{2}$  tola the scale progressed by 2 annas per tola, and thereafter by  $\frac{1}{2}$  anna per tola. In 1869, the weight allowed for each rate of postage was doubled, the initial charge becoming half anna for  $\frac{1}{2}$  tola. This rate continued in force until April 1904, when the weight allowed for  $\frac{1}{2}$  anna was raised to  $\frac{3}{4}$  tola. The charge for heavier letter was 1 anna for  $1\frac{1}{2}$  tolas.

The minimum postage on newspapers was originally 1 anna for 6 tolas of weight; but the rates were from time to time reduced. In October 1898,  $\frac{1}{2}$  anna was made the inland rate for a newspaper not exceeding 4 tolas in weight, and  $\frac{1}{2}$  anna the rate for a registered newspaper, exceeding four but not exceeding 20 tolas. While an additional  $\frac{1}{2}$  anna was charged on every additional 20 tolas or part of that weight, the weight allowed for  $\frac{1}{2}$  anna was raised to 6 tolas in January 1904. The postage on packets other than newspapers was 1 anna for 10 tolas until 1878, when it was lowered to  $\frac{1}{2}$  anna.

The Post-Office first carried parcels at rates varying with weight and distance. In 1870, a uniform rate of 3 annas for 10 tolas was adopted. In 1873, the minimum charge was fixed at 4 annas for 20 tolas, but four years later it was altered to 8 annas for 40 tolas. The rates of inland parcel postage which came into force in July 1901 were: (1) in the case of parcels not exceeding 440 tolas in weight, 2 annas for the first 20 tolas, 4 annas for any weight exceeding 20 but not exceeding 40 tolas, and 2 annas for every additional 40 tolas; and (2) in the case of parcels exceeding 440 tolas in weight, Rs. 3 for a parcel not exceeding 480 tolas in weight and 4 annas for every additional 40 tolas. As the limit of weight, which was 2,000 tolas, was found to be interfering with the railway parcels traffic, it was reduced to 800 tolas in 1907.

The Postal Act 1854, superseding the previous practice of giving receipts for all letters at the time of posting, added registration of postal articles as a new facility for the public, the fee being 2 annas for all classes of articles.

The insurance of postal articles was introduced in 1878, mainly in order to separate valuable articles from the rest of the mail. There was at first no restriction on the amount for which the article might be insured; but in 1890 a limit of Rs. 1,000 was fixed which was raised in 1898 to Rs. 2,000. The limit has since been raised several times. The insurance fee was reduced in 1905 from  $\frac{1}{2}$  to  $\frac{1}{4}$  per cent on the value, subject to the minimum of one anna.

The value payable, or, cash on delivery system, was introduced into

India in December 1877 and, under this system, the Post-Office undertakes to collect from the addressee the price specified for payment on certain classes of articles sent for sale and transmit the money to the sender. It was extended in 1891 to the postal exchange between India and Ceylon/Sri Lanka.

In 1875, the Universal Postal Union was established. In the following year, India became a member and party to the Convention which regulated the carriage of letters, postcards and packets between all countries of the Union. In 1892, India applied the standard Union rates to correspondence for all parts of the world, whether within or outside the Postal Union; and in 1898 she joined in the scheme for the adoption of a uniform rate of postage at the rate of a penny per half ounce for letters throughout the British Empire.

In 1873, arrangements were made for the carriage of parcels to and from England and for their collection and distribution by the Peninsular and Oriental Navigation Company. This was soon followed by the introduction of exchanges of postal parcels with certain other European countries and with several British colonies. In 1885, the exchange of parcels with the United Kingdom was transferred to the agency of the British Post-Office and in 1895, India joined the International Parcel Post Union which enabled parcels to be exchanged by post between India and almost every other country in the world.

Prior to 1880, sums not exceeding Rs. 150 could be remitted by money order from one district to another through the agency of the Government Treasuries. A commission of about 1 per cent was charged, the remitter sending the order obtained from the remitting Treasury to the payee who was required to present it at the Treasury of payment. The cost of transmitting the order was a charge over and above the commission and there was the risk of the order being lost or stolen in the post unless forwarded under the security of registration. With less than 300 Treasuries, the system was not popular and could not compete with the remittance of currency notes by post. The service could be improved under the Post-Office which had 5,500 offices. From January 1, 1880, it was decided that the money order business should be taken over by the Post-Office. The commission remained the same but the procedure was greatly simplified. The remitter had only to fill in an application, the Post-Office undertaking to transmit the money to the payee and to obtain his acknowledgement and deliver it to the remitter. The success of the Post-Office handling this was shown by the fact that the transactions more than quadrupled within three months.

Among the several improvements effected later were: the addition to the money order form of a "coupon" on which the remitter could write a communication to the payee; the payment since 1884 of money orders by postman at the residence of the payees; the introduction, also in 1884,

of the telegraphic money order system; and the use of finger impressions for the identification of illiterate payees.

The rate of the commission for ordinary money orders were: 1 anna per Rs. 5, or fraction thereof upto Rs. 15, 4 annas on sums between Rs. 15 and Rs. 25; for telegraphic money orders the scale of charges began with 2 annas for any sum not exceeding Rs. 10, and progressed in the same way as money order rates upto Rs. 150. For any sum exceeding Rs. 150 upto Rs. 600, the charge was Rs.  $1\frac{1}{2}$  for a complete sum of Rs. 150 plus 2 annas per each additional sum of Rs. 10. For the cost of the telegram in the case of urgent orders, the further fee was a rupee and in the case of deferred orders 8 annas.

On the money order system proper were grafted measures for the remittances of rent to landowners and of Government dues such as land revenue, cesses and income-tax. These facilities had a special value in protecting the people from illegal exactions. The landowner was saved from improper demands made by subordinate revenue officials and the tenant was protected against the landlord or his agents.

Foreign money orders were drawn upon or received from the United Kingdom and also most British colonies and foreign countries in sterling. There were also a few foreign countries and British possessions to and from which money orders were advised in Indian currency.

The sale of British postal orders for small sums, payable in the United Kingdom and at certain British post-offices in foreign countries, was introduced in India in 1884. The number sold in 1890-91 was 39,683 of the total value of £27,761. With the introduction of more denominations, the number issued showed a marked increase to 453,943 in 1913-14. The number, however, declined in the following years, touching 121,501 by 1921-22. During the inter-war period, the sales improved, but the setback during World War II and the later years led to its final discontinuance by April 1, 1951.

The Post-Office provided for the use of the public postage stamps of various denominations (14 in 1904), embossed envelopes, postcards and newspaper wrappers. Stamps required for official purposes were overprinted "On H.M.S." (On His Majesty's Service). The colour and design of the postage stamps underwent various changes from time to time, the most important being in 1900 when India adopted the colours green, red and blue recommended by the Universal Postal Union for the stamps representing the three standard Union rates of 5 centimes, 10 centimes and 25 centimes, the Indian equivalent of which being  $\frac{1}{2}$  anna, 1 anna and  $2\frac{1}{2}$  annas.

The one-quarter anna inland postcard in 1879, sold for its face value, gave a lower rate of postage than had been available. In April 1880, service postcards for the use of Government officials were also provided. Reply postcards were introduced in 1884. The introduction of

the postcard, the most popular medium of private correspondence in India, aroused considerable opposition in the public press, mainly on ground that it would interfere with the secrecy of postal communication.

**Postal Savings Banks:** As the Post Office happened to be the only organization of the Central Government having a large network of establishments covering the entire country, it took over the responsibility for a number of services of a variegated character which had nothing to do with the primary function of carrying mails. In addition to those already referred to, the post-offices sold stock notes from 1882 onwards and, as from 1886, the purchase and sale of Government Promissory Notes were also undertaken. Perhaps the most important was the service performed by the Post-Office by the institution of savings banks.

Post-Office savings banks came into existence in April 1882 and by April 1883 they were in operation throughout India. The post-office savings banks and the district savings banks, instituted in 1870 in connection with certain treasuries, continued side by side till 1886, when the latter were abolished. Only the Government savings banks in the cities of Calcutta, Bombay and Madras remained in the hands of the Presidency Banks until 1896.

The popularity of the post-office savings banks was evidenced soon after they were opened in 1882-83. The number of depositors in that year was 38,121; the amount at their credit nearly Rs. 28 lakhs, and the interest which they received was Rs. 49,020. By the turn of the century, the number rose to 736,000 and the amount to Rs. 965 lakhs. The minimum deposit was four annas and the maximum total credit permitted was Rs. 2,000. The interest was formerly allowed at the rate of  $\frac{1}{4}$  anna a month on every complete sum of Rs. 6, equivalent to  $3\frac{1}{4}$  per cent per annum, which was later reduced to 3 per cent on deposits held at call and raised to  $3\frac{1}{2}$  per cent on deposits requiring six months' notice of withdrawal. The Post-Office received no remuneration for its savings bank, all incidental expenses in connection therewith being borne by it. The Post-Office also afforded facilities to invest in Government securities any sum in whole rupees from Rs. 10 to Rs. 1,000 in any one year, provided the depositor's total investment including his current deposit account did not exceed Rs. 5,000. At his option, the securities purchased may be kept by himself or on his behalf by the Comptroller.

The rapid progress at first of the post-office savings banks was slowed down by the lowering of interest and the reduction in the permissible annual and total amounts to be deposited. The total balances varied regularly with the economic conditions of the country, a famine year showing a considerable decrease and a better agricultural season an improvement. Similarly, war and war scares also made the deposits

sensitive. During both World Wars, there were unprecedented withdrawals. In 1914, the balances dropped from Rs. 23 crores to Rs. 16 crores. In 1940-41, the balances came down from Rs. 81.86 crores (as of 1938-39) to Rs. 59 crores. There were also the decreases, as were to be expected, from the separation of Burma in 1937 and the partition of India in 1947. But the general trend, allowing for these factors, was steadily upward. Since 1947, the deposits and the annual balances have responded to the better facilities and the economic progress of the country. The balance at the end of 1961-62 amounted to Rs. 466.54 crores as compared with Rs. 142.35 crores and Rs. 167.17 crores on March 31, 1947 and 1950, respectively. The average balance per depositor has risen from Rs. 122.8 in 1900 to Rs. 358.9 in 1947 and Rs. 492 in 1962. These increases are all the more striking as there had been, during the period covered, a considerable expansion in savings bank facilities provided by commercial banks.

**Railway Mail Service:** With the commencement of the railways, an obligation was imposed on them to carry letters and parcels free of charge and the Provincial Governments were empowered to require the railways to run trains to carry the mails. The mail bags were at first carried as such in a guard van or a separate compartment. Sorting of mails in transit was a later development, first at large centres and subsequently in 1870 with the mail service. In 1877, Government decided that the Post-Office should pay the railways for the cost of conveyance. Postal vans were standardized in 1882. The basic principles applied to the carriage of mails by rail adopted at this time have continued since then without much change.

**Progress of Postal Services from 1860 to 1947:** The steady expansion of post-offices in the country led to a progressive increase in the volume of work handled by them. In forty years from 1860-61 to 1900-1901, the number of post-offices rose from 889 to 12,970 and the letter boxes from 190 to 25,507. The number of postal articles handled rose from 48 millions to 582 millions over the same period. During the next forty five years, 1901-02 to 1945-46, which included two World Wars and separation of Burma, the number of post-offices doubled and the number of articles handled increased to 370 per cent. The same picture is presented by the money order business and the post-office savings banks.

The length of postal lines steadily rose from 70,148 km. in 1860-61 to 191,910 km. by 1900-1901. By 1950-51, the figure had gone up to 260,989. In assessing the progress, it is necessary to make allowance for the separation of Burma in 1937 and the partition in 1947.

**Mail Runners:** In some of the branch offices, the mail runners, a unique figure in the dispersed areas, with their belts and badges, had spears

with clusters of small bells attached, which, beside being useful in scaring away wild animals by their jingle, helped the runners to travel at a measured pace and notify the approach of the mails. Ordinarily, the mail bags are tied together and suspended to one end of the spear and thrown over the shoulder. In many parts of the country—mail runners have been exposed to considerable danger from different causes, such as floods, storms, wild beasts, and on occasions to highway robbers. Although the mails usually contain cash and other valuables, it seldom happens that a runner attempts to tamper with them. On the other hand, there are many cases on record in which the runners have defended the mails in their charge at the risk or cost of their own lives.

**Mails to and from Foreign Countries:** Postal traffic with foreign countries forms an important part of the activities of the Post-Office. The earliest mail communication between Europe and India was by sailing vessels, starting at irregular intervals from England and proceeding round the Cape of Good Hope. In 1815, the charge for a single "letter" was 3s. 6d. payable on delivery in India, of which 2d. was paid to the ship with an additional 2d. to the commander. But soldiers in the service of the Company or the Crown were privileged to send and receive letters at the rate of 1s. In 1825, the voyage was for the first time performed by steam. It was not until 1835 that the Indian mails were conveyed over the isthmus of Suez and through the Red Sea. In 1840, the Peninsular and Oriental Navigation Company was selected to convey mails to Alexandria, and, in 1842, the company established a line of steamers between Suez, Ceylon, Madras and Calcutta for which in 1844 it received a contract for five years with a subsidy of £250,000 for the combined India and China services. This contract was subsequently extended from time to time. It provided in 1853 for a fortnightly service between the United Kingdom and India (Calcutta), and in 1867 for a weekly mail service to and from India (Bombay) with a transit of about twenty-six days. The annual subsidy increased to £400,000 to be raised, if necessary, upto £500,000 to give the company a net profit equal to 6 per cent on its capital. In 1880, the weekly service and transit of mails were brought down to 17½ days. In 1888, the conveyance of the mails through the Suez canal, instead of across Egypt, reduced the time by one day, and later 14½ days for the entire transit. The subsidy also came down gradually to £330,000 under the combined Eastern and Australian mail service 1898-1905.

From 1854 to 1869, the trans-European route for mail service between the U.K. and India was *via* Marseilles, but towards the end of the latter year the service by that route was supplemented by a service *via* Brindisi. The sorting of mails on board and mail steamers in the Indian Ocean

was introduced in 1868 and the mails landed at Bombay ready sorted for chief towns.

**Field Post-Officer:** The Post-Office was called upon from time to time to serve the field forces on military expeditions. Indian postal staff went on active service on several occasions, such as with the Persian expedition in 1856 and Expeditionary Force in Abyssinia in 1867, in the Afghan Wars of 1878-80, Egypt in 1882-83 and Sudan in 1885, with the Chinese field forces in 1901, in Somaliland in 1903, in Mesopotamia, East Africa and Persia during the World War I and World War II.

**Service Stamps:** Upto 1865-66, all official articles were conveyed free and the Government Departments concerned were pro-forma debited with the postage due from them. The result was in almost unrestricted licence to frank letters on public service. In 1867, service stamps were introduced and pre-payment of official correspondence was insisted on. At first restricted to official articles passing out of Presidency towns or outside the limits of the district in which they were posted, it was gradually extended, until in 1873 all franking privileges were abolished. This tended to keep within reasonable limits the amount of official correspondence conveyed by the Post-Office.

The rates of postage applicable of official correspondence were originally the same as for ordinary correspondence. But, taking into account that the official covers were larger and less troublesome or expensive to deal with, the rates were reduced in 1873. Further reductions were made in later years by which the permissible weight was raised to 10 tolas against  $1\frac{1}{2}$  tolas for private letters. The rates applied to parcels and packets were the same.

**Postal Insurance:** The Indian Post-Office has an insurance branch from which any Government servant subject to civil rules can obtain a life insurance or endowment policy upto Rs. 4,000 or an annuity upto Rs. 50 a month. Originally started in 1883 for the postal servants, it was gradually extended to civil employees of Government. In 1949, however, the facility was extended to members of the Defence Services as well as to employees of certain semi-Government institutions. The number of policies issued has in recent times declined considerably. Between 1955-56 and 1962-63, the civil portion of the life insurance policies issued dropped from 17,074 to 4,100 and the military portion from 1,026 to 320. In 1950, the grant of loans on the security of the policies was also allowed.

**Air Mail Services:** India is perhaps the first country in the world to have flown mails, although in an experimental way, when on February, 21, 1911, a de Havilland aircrafat carried mails comprising about 6,500

letters during a demonstration flight from Allahabad to Naini across the river Yumana. Regular use of air services for carrying mails, however, had to wait till 1920 when the air service between Bombay and Karachi was started. On April 7, 1929, the U.K. — India air mail service was inaugurated. Six months later an Indian air company carried a feeder air mail service between Delhi and Karachi. The eastern service of the K.L.M. and of Air France also traversed India about this time. In 1931, the Indian Post-Office introduced the air mail postcard. Under the Empire Mail Scheme in 1938, the mail service operated four times a week between London and Malaya, touching Karachi and Calcutta.

There has been steady improvement in the air mail service since independence, and this has kept pace with the extension of air services in the country.

The inauguration of the Night Air Mail Scheme in Nagpur in January 1949, was a landmark in the history of airborne mails in the country. This service, working in conjunction with the day air services at the four-terminal stations at Madras, Bombay, Calcutta and Delhi, provided a channel for continuous aerial transmission of mails between the four corners of India, greatly cutting down the mail transit time. This was followed by the "All Up" Scheme on April 1, 1949, under which all unsurcharged first class mail was given air lift, wherever such air lift resulted in speedier delivery.

In May 1951, money orders were also brought under the "All-Up" Scheme and, in September of the same year, insured letters were also included. In the following month, the inland letter card, designed on the pattern of foreign air letters, was introduced and priced 1½ annas.

The volume of the traffic carried by air mail, foreign and inland, is indicated in the following Table:

TABLE XXXI  
Volume of Foreign and Inland Air Mails  
1956-57 to 1968-69 (Select Years)  
(Figures in thousands)

|         | <i>Outwards<br/>Foreign (kgs.)</i> | <i>Inwards</i> | <i>Inland<br/>(lbs.)</i> |
|---------|------------------------------------|----------------|--------------------------|
| 1956-57 | 334                                | 597            | 14,140                   |
| 1958-59 | 412                                | 696            | 9,980                    |
| 1959-60 | 444 (403)                          | 769            | 10,598                   |
| 1964-65 | 647                                | 1,403          | 6,120 (kg.)              |
| 1967-68 | 783                                | 1,918          | 7,093 (kg.)              |
| 1968-69 | 742                                | 1,749          | 6,669 (kg.)              |

**Agency Functions:** Among the several agency functions undertaken by the Post-Office, the most important is the sale of savings certificates. The Five-Year Post-Office Certificates date back to 1917. Besides

these, in order to encourage small savings, the Post-Office in the past had sold the war loans and in 1940, the Defence Savings Certificates, later replaced by the National Savings Certificates. The business reply cards were introduced in 1932, and in 1934, on behalf of the Finance Department, the Post-Office undertook the sale of revenue stamps for use in payment of duty under the Indian Stamps Act. Ten years later, it took over the sale of the tobacco excise revenue stamps for the collection of fees on tobacco excise licences. A year later, it handled the sale of the Central Excise revenue stamps.

The sale of quinine to the public has been one of the oldest agency functions of the post-office. During 1962-63, the Post-Office sold through the agency of its offices in Central, Madras and West Bengal Circles 317 lbs. and 144,000 tablets of quinine and its substitutes. The other States had their own arrangements.

Since 1947, the department continued to enlarge the sphere of its activities. In 1950, on behalf of the Ministry of Health, it put on sale the T.B. Seal on its counters. At the instance of the All India Khadi and Village Industries Board, arrangements were made to sell *Khadi Hundies* during September 1954 to March 31, 1955.

**Increase in Number of Post-Offices since 1951:** There has been an acceleration in the development and expansion of the postal services since independence. As a result of the Five-Year Plans, the progress has been systematic and continuous. The objective in the First Plan, 1951-56, was to serve, besides all administrative headquarters such as *tehsils*, *talukas* and *thanas*, every group of villages located within a distance of 3.22 km. and having a population of 2,000, provided the annual loss did not exceed Rs. 750 and there was no Post-Office within a distance of three miles.

The conditions for opening Post-Offices were relaxed during the Second Plan, 1956-61, and the programme aimed at providing Post-Offices to each group of villages within a radius of two miles and having a population of 2,000. In addition to these, Post-Offices were also sought to be provided at every headquarters of National Extension and Community Project Blocks, subject to the conditions relating to the permissible limits of annual loss and distance. The conditions for opening Post-Offices were further liberalized in 1950 by including also places where schools were run by district boards or schools run were approved by the State Governments.

As a result of these steps, the number of Post-Offices in the country increased from 36,000 to 55,000 in 1955-56, and to 77,000 in 1960-61. The increase during the period of the Third Plan was 20,942. The total number by the end of 1968-69 was 102,477.

The needs of rural areas received special attention and, as a result of this, the number of villages obtaining daily service increased from 186,661 in 1956-57 to 320,311 on December 31, 1969. There are no more "No Dak" villages

There were on the same date 48,991 villages receiving mails at an interval of one week and 7,702 villages at an interval of more than a week. There have been a steady improvement during the plan periods.

**Mobile Post-Offices:** In 1948, a novel experiment of a post-office on wheels on a fixed schedule was started covering about 150 villages in the Nagpur-Wardha-Yeotmal-Amraoti region. This had to be given up as it proved highly uneconomic. In the following year, however, a night mobile Post-Office was started at Nagpur as an adjunct of the Night Air Mail services. It was soon extended to Madras, Delhi, Bombay and Calcutta. The mobile Post-Office goes to important centres in the city at specified hours after dusk and after the normal working hours of post-offices. It works during all the days of the year, but does not book money orders or do savings bank work. A floating mobile Post-Office was opened at Srinagar in 1953, working in a *shikara* on the Dal Lake and the Jhelum river to meet the needs of tourists staying in house-boats. Towards the end of 1969, 15 mobile Post-Offices were functioning in all "A" Class and "B" Class cities.

**Growth of Postal Traffic and Revenues:** Since independence, there has been a growing demand for communication facilities represented by the postal, telegraph and telephone services and overseas communications. The progress during the period of the three Five-Year Plans and the three Annual Plans may be judged from the comparative figures relating to 1948-49 and 1968-69 set out below:

|                                              | Figures in million |         |
|----------------------------------------------|--------------------|---------|
|                                              | 1948-49            | 1968-69 |
| (1) Postal articles (excluding money orders) | 2,264              | 6,056   |
| (2) Registered articles                      | 76                 | 178     |
| (3) Money orders                             | 45                 | 100     |
| (4) Savings Bank (transactions)              | 9                  | 69      |

A perspective view of the development of postal facilities related to population is afforded by the figures given in the Table XXXII.

With 100,000 Post-Offices, there is a Post-Office for every 6.4 villages, 5,000 population and 37 sq. kilometres in the country. This compares favourably with the statistics of certain foreign countries as shown in Table XXXIII.

**TABLE XXXII**  
Average Revenue and Traffic per head of Population: 1921—1968-69

| <i>Year</i> | <i>Population<br/>(million)</i> | <i>Revenue<br/>Rs.<br/>Crores</i> | <i>No. of<br/>articles<br/>(millions)</i> | <i>Average<br/>revenue per<br/>head of<br/>population<br/>(Rs.)</i> | <i>Average No.<br/>of articles<br/>per head of<br/>population</i> |
|-------------|---------------------------------|-----------------------------------|-------------------------------------------|---------------------------------------------------------------------|-------------------------------------------------------------------|
| 1921        | 310                             | 5.82                              | 1,410                                     | 0.19                                                                | 4.34                                                              |

**TABLE XXXIII**  
Average Population and Area per Post-Office in India and Certain  
Foreign Countries

| <i>Country</i> | <i>No. of<br/>Post-Offices</i> | <i>Population per<br/>Post-Office</i> | <i>Area per Post-<br/>Office<br/>(Sq. km.)</i> |
|----------------|--------------------------------|---------------------------------------|------------------------------------------------|
| Australia      | 8,179                          | 1,204                                 | 942                                            |
| Canada         | 11,205                         | 1,542                                 | 862                                            |
| Great Britain  | 24,937                         | 2,065                                 | 9.87                                           |
| Japan          | 15,971                         | 5,760                                 | 23.10                                          |
| U.S.A.         | 36,308                         | 4,802                                 | 264                                            |
| India          | 88,058                         | 4,988                                 | 37.30                                          |

The total capital outlay on the Post-Office to the end of 1968-69 is Rs. 15.22 crores, of which Rs. 1.05 crores are from ordinary revenue. The financial results of working the Post-Office disclose fluctuations, surpluses in some years and deficits in others. Because of its being administered along with the Telegraph Department together with the telephones and the radio, the total results are better indicatives of the working of the entire organization. The working of the Post-Office has on the whole resulted in a surplus. Taking the period 1956-57 to 1968-69, the surpluses and deficits have been as follows:

**TABLE XXXIV**  
Surplus or Deficit in Working the Post-Office during 1956-57 and 1968-69

| <i>Year</i> | <i>(In crores of Rs.)</i> |                   |
|-------------|---------------------------|-------------------|
|             | <i>Surplus +</i>          | <i>Deficit --</i> |
| 1956-57     | + 1.33                    |                   |
| 1958-59     | — 1.99                    |                   |
| 1959-60     | + 1.30                    |                   |
| 1960-61     | + 0.80                    |                   |
| 1961-62     | — 0.87                    |                   |
| 1962-63     | + 2.24                    |                   |
| 1963-64     | + 0.79                    |                   |
| 1964-65     | + 3.44                    |                   |
| 1965-66     | — 3.28                    |                   |
| 1966-67     | — 3.28                    |                   |
| 1967-68     | — 8.34                    |                   |
| 1968-69     | — 14.12                   |                   |
|             | — 6.16                    |                   |

The financial result, of working the Post-Office during 1968-69 are as follows:

|                         | (In Crores) |
|-------------------------|-------------|
| Total receipts          | Rs. 93.98   |
| Net working expenditure | Rs. 99.16   |
| Dividend                | Rs. 0.98    |
| Deficit                 | Rs. 6.16    |

There are three Reserve Funds. The Renewal Reserve Fund for the Post and Telegraphs Department has shown a steady increase under the closing balance. From Rs. 5.89 crores in 1955-56, it has gone upto Rs 101.55 crores in 1968-69, representing in this year 28.8 per cent of the value of the total fixed wasting assets.

The closing balance in the Capital Reserve (Post and Telegraphs) was Rs. 2.29 crores on March 31, 1969. The Revenue Reserve Fund (Postal) on this date was overdrawn by Rs. 23.82 crores.

**Telegraphs:** The earliest experimental telegraphic lines in India were those for which, in 1951, Dr. W. B. O'Shaughnessy, Assistant Surgeon and Professor of Chemistry in the Medical College at Calcutta, obtained sanction to construct along the Hooghly from Calcutta to Diamond Harbour, with a branch from Bishtopore to Mayapur and an extension from Kukrahati to Kedgerree, making with some short additional sections, a total of 132 km. In the same year, offices were opened at Calcutta, Mayapur, Bishtopore and Diamond Harbour for business connected principally with shipping. To these were added in February 1852, Kukrahati and Kedgerree. The receiving instrument was a small galvanoscope designed by Dr. O'Shaughnessy and made in India, and this pattern continued in use until 1857 when it was replaced by the Morse instrument.

These experimental lines proved successful and Lord Dalhousie obtained sanction from the Court of Directors for the construction of lines from Calcutta to Agra, Agra to Bombay, Agra to Peshawar, and Bombay to Madras, extending in all over 4,848 km. and including 41 offices. These were opened for paid message traffic in February 1855. By 1857, the lines had been further extended, bringing Mysore, Ootacamund and Calicut into the system, which now amounted to 7,331 km. of wire and 62 offices opened to public.

During the revolt of 1857, the Telegraph office was able to render notable service, indicating thereby the political value of the telegraph. Nearly 3,219 km. of line were constructed during the following year in addition to the reconstruction of the lines destroyed during the convulsion. Since then the Department has steadily expanded year by year. Steady progress was also maintained in establishing telegraphic connections with countries outside India. All telegrams on the service

of the State were paid for, except those relating to the service of the Postal and Telegraph Departments.

**Tariff — Local and Foreign:** The Tariff was first fixed at Re 1/- for each 16 words, including the address for transmission over 644 km. of telegraph line and at double this charge on telegrams presented between 6 P.M. and 6 A.M. After several experimental modifications, a revised tariff was introduced in January 1882, under which the charge was made uniform for all hours of the day and night and for any distance, the address being signalled free in all cases. In 1886, telegrams were classified into 'Urgent', 'Ordinary' and 'Deferred', the charges for these being Re. 1 for 8 words and 2 annas for each additional word for 'Ordinary', double these rates for 'Urgent' and half the ordinary rates for the 'Deferred'. There were several changes in the tariff from time to time.

For messages between India and the U.K., the original tariff was £5 for 20 words. This was reduced to £2-17-6 in 1868 and raised to £4-10-0 in 1871. In 1875, this was replaced by a word rate of 5½ Francs *via* Suez or Tehran and 5 Francs *via* Turkey. Since 1885 the rates were gradually reduced to 2s. The tariff for foreign countries were susceptible of variation, being made up of the shares of different administrations concerned and in accordance with the alterations in rate made by them and the routes employed.

Press telegrams were given the privilege of despatch at a far lower rate than was allowed for ordinary private messages, namely, about one-sixth of the usual rate, for inland press messages; about one-third, for foreign press messages.

During 1895-96, the phonogram was introduced at Bombay and Calcutta, by which any telephone subscriber could for a nominal charge read out his telegram by phone to a departmental telegraph office where it was booked and transmitted to its destination in the usual way by the telegraphic service.

**Progress of Telegraph Services:** The growth of the telegraph transactions at the turn of the century may be indicated by a few figures. In 1860-61, about 17,710 km. of telegraph lines had been opened with 145 offices. In 1900-1901 there were 88,550 km. of telegraph line with 1,939 offices which dealt with more than 6,462,000 messages, about 90 per cent of these being for the public. The net revenue earned by the Department showed a profit in that year of 6.2 per cent on its capital outlay, without taking into account the Home charges, including those of the Indo-European Telegraph Department.

The Indo-European department was in charge of that portion of the system of telegraphs between England and Karachi which was owned by the Government of India. This included: (1) the Persian

Gulf section from Karachi to the head of the Persian Gulf and connecting the Indian Telegraph lines terminating at Karachi with the Persiad section at Bushire and the Turkish telegraph at Fao.

Efficient and prompt maintenance and repairs could hardly be undertaken without an adequate workshop. A Central Workshop was established in 1885 and this was later supplemented by another at Calcutta. During World War I, these workshops turned out many useful articles. A store depot was opened in Lahore in 1932. There were similar depots at Calcutta and Bombay. The workshops manufactured many important items such as telephone switch-boards.

There was a rapid development of the telegraph service after World War I, as will be seen from the figures shown in the following Table relating to the telegraph offices and licensed offices.

TABLE XXXV  
Progress of Telegraph Offices and Traffic  
1921-1936 (Select Years)

| <i>Year<br/>ending<br/>March 31</i> | <i>No. of<br/>Telegraph<br/>Offices</i> | <i>No. of<br/>Telegrams<br/>(in '000)</i> | <i>Telegraphic<br/>Revenue<br/>in lakhs of Rs.</i> |
|-------------------------------------|-----------------------------------------|-------------------------------------------|----------------------------------------------------|
| 1921                                | 3,584                                   | 19,893                                    | 3.24                                               |
| 1926                                | 3,851                                   | 18,778                                    | 2.88                                               |
| 1931                                | 10,540                                  | 18,124                                    | 2.68                                               |
| 1936                                | 10,394                                  | 17,152                                    | 2.68                                               |

A number of additional items of service to the public were introduced by the Department during the inter-war period. Among these may be mentioned the "Greetings Telegram" as from June 2, 1931, the "De Luxe Telegrams" to certain Empire countries in 1938, and the "De Luxe Inland Telegrams" as from June 1, 1938.

The teleprinter system was introduced between Delhi and Agra. In 1932, a four-channel HF telegraph carrier, the first of its kind in India, operated between Bombay and Calcutta. The teleprinter routes installed on November 26, 1936, were expanded to include two systems between New Delhi and Bombay and a system each between Madras and Bombay and Karachi and Bombay.

The telegraph system prior to partition, as on March 31, 1947, stood as follows:

**Lines and Cables**

|                               |             |
|-------------------------------|-------------|
| Post lines                    | 188,694 km. |
| Wire Copper, Iron and Bronze  | 1,138,148 " |
| Cables, Aerial u/g, submarine | 8,461 "     |

**Telegrams:**

|                 |                 |
|-----------------|-----------------|

Booked  
Delivered  
Revenue

945,553  
358,689  
Rs. 1,18,200

**Development during the Five-Year and Annual Plans:** Since independence, the policy of expanding telegraph facilities, particularly in the rural and semi-urban areas, was vigorously pursued by the Department. Until 1951, no scheme for opening a telegraph office could be taken up unless it was profitable. From October 1951 onwards, the policy was gradually liberalized. At first, special consideration was given to places where the loss in working would not exceed Rs. 500, and this was later raised to Rs. 1,000. In September 1953, it was decided to open telegraph offices at all district towns without any limit of loss and, subject to a loss not exceeding Rs. 1,000, at subdivisional and tehsil towns. During the Second Five Year Plan, the programme of extension of telegraph facilities to rural areas with a population of more than 5,000 was taken up.

The number of telegraph offices in the country increased from 3,000 in 1950-51 to 12,612 in 1955-56.

The Indian Language Telegraph Service in *Devnagri* script, called Devnagri Telegraph Service, which started in nine offices on June 1, 1949, covered 2,518 offices on March 11, 1966. The number of telegrams in *Devnagri* script during 1965-66 was 341,766, the total number of telegrams handled during the year being 40 millions.

The programmes of improvement and development aimed at reducing the time interval between the initial booking and the delivery of the telegrams. This has necessitated the installation, on an extensive scale, of modern devices such as teleprinters and tape-relay systems to avoid repeated handling of telegrams and the gradual replacement of morse working. Further improvement, such as additional teleprinter exchanges, telex services and voice frequency telegraph channels, contemplated during the Fourth Plan period.

The financial results of working of the Telegraph Branch during 1968-69 may be seen from the following Table:

TABLE XXXVI

Financial Results of Working of the Telegraphs Branch during 1968-69

|                              | In crores of Rs. |
|------------------------------|------------------|
| Total revenue                | 22.52            |
| Total net working expenses*  | 25.90            |
| Dividend to General Revenues | 4.06             |
| Deficit                      | -7.444           |
| Progressive capital outlay   | 103.22           |
| Balance in Renewals R. Fund  | -16.68           |

\*Includes dividend and contribution to Renewals and Reserve Fund.

**Telephones:** In 1881 and 1882, the Government of India granted to the Oriental Telephone Company licences to establish telephone exchanges at Bombay, Madras, Calcutta, Karachi and Rangoon. Permission was given to the company to erect private lines each under a separate licence in the localities not covered by the exchange licences.

In 1882, the Bombay Telephone Company, to which the licence was transferred, was established under the Companies Act with a nominal capital of Rs. 9.4 lakhs and 90 subscribers. The Bengal Telephone Company started in the previous year with 102 subscribers. In smaller towns, the Government itself assumed the responsibility to run its own telephone system. Even in the larger cities like Bombay and Calcutta, where private companies had been given the licences to run the services, the Government had its own telephone system for its offices.

The policy in regard to telephones was laid down in the Simla resolution of October, 25, 1883, which stated that the Government of India had no desire to compete with private enterprise in the matter of telephone exchanges in the country but reserved to itself the right to undertake such business in places where private agencies were not prepared to take it up. Also, so long as the business was conducted satisfactorily and in terms sufficiently advantageous to the public there would be no necessity of taking over.

By 1900, there were 46 departmental exchanges with 401 exchange connections and 535 private lines. The telephone companies at Calcutta, Madras, Bombay, Karachi, Ahmedabad, Rangoon and Moulmein had 2,005 connections and 273 private lines. The magneto exchanges eventually gave way to Central battery exchanges and later to the automatic. A number of public call offices were also functioning in places such as Mussoorie, Landour, Dehra Dun and Kulri Bazaar.

On January 1, 1907, irrespective of the number of calls, uniform rates were made for 8 hours', 16 hours' and 24 hours' service at Rs. 120, Rs. 135 and Rs. 150 per annum, respectively, on all connections not exceeding 2 miles in length from the departmental exchange. Internal installation charges were also made to vary respectively for these different hours of working at Rs. 90, Rs. 100 and Rs. 112 per connection not worked by the Telegraph Department.

In 1914, the first automatic telephone exchange was installed at Simla; the second at Poona. Automatic exchanges were later extended to Ootacamund, Gomoh, Allahabad, Delhi and Lahore. The telephone companies in Bombay and Madras also kept pace with developments replacing their system by automatic system.

By 1920-21, there were in the country 255 exchanges with 10,703 connections owned and maintained by the Government of India, of which a few were not operated by the Department. The gross rental from

the Railways and Canals was Rs. 14.84 lakhs. The licensed telephone companies owned 11 exchanges with 20,335 connections and these earned Rs. 34.91 lakhs. The trunk lines extended to 9,034 km.

The inter-war period witnessed a boom followed by a world wide depression. During this period, there were a number of changes in the service and technical sides — in 1923, a 145 km. long distance channel between Lahore and Lyallpur, the use of a single channel carrier between Delhi and Agra in 1930 which brought telephone communication without erection of additional wire, and radio-telephone connection between England and India in 1933 and with Burma in 1936. When the World War II broke out there was a sudden demand for communication facilities from the administrative and defence services. The Telecommunication Development Board was set up in 1942 to co-ordinate the requirements and the plans for expansion.

During 1941-43, the Government of India exercised their option to terminate the licences of the private telephone companies and the Department took over the administration of the Bombay, Calcutta and Madras telephones. After the termination of the war and, when independence came, it became possible for the Department to undertake expansion of its services on a scale adequate to the growing requirements of the country. The Federal Financial Integration of the States into the Union on April 1, 1950, brought with it the lines previously operated by them, consisting of 196 exchanges of varying capacities, designs and installed capacity with 13,362 lines and 11,296 working connections.

**Progress under Five Year Plans:** Together with the expansion of development of the telephone system of the country came also the modernization of the equipment and their housing in new buildings. With the commencement of the Five-Year Plans, the schemes of the Department were integrated into the overall national plan. During the First Plan, for which Rs. 39.59 crores were provided, considerable progress was made on the schemes of automatization and expansion of the Calcutta exchange which had not responded to these changes during the company management; further progress was made in the development of the Madras and Bombay exchanges. By the end of the First Plan, 109,600 telephones, 347 trunk exchanges and 44,803 carrier telephones were added to the system. By the end of the Second Plan, 183,400 telephones and 564 exchanges were installed. By the end of the Third Plan, 401,000 telephones were added giving a total of 870,000 connections.

During the Third Plan and the Annual Plan period of 1967-68 and 1968-69 the increases recorded against partical items are shown in the following Table:

**TABLE XXXVII**  
**Development During the Third Plan and Annual Plans Relating to the Telephones**

|                                            | <i>Third Plan</i><br>1961-62 to<br>1965-66 | <i>Annual Plans</i><br>1967-68      1968-69 |         |
|--------------------------------------------|--------------------------------------------|---------------------------------------------|---------|
| (1) No. of telephone exchanges opened      | 1,537                                      | 266                                         | 271     |
| (2) No. of direct exchange lines installed | 359,240                                    | 65,374                                      | 67,058  |
| (3) No. of telephones installed            | 396,415                                    | 83,819                                      | 103,630 |
| (4) Micro-wave route opened (km.)          | 190                                        | 200                                         | 100     |
| (5) Coaxial route opened (km.)             | 3,150                                      | 552                                         | ..      |

The quality of the service to the public has been steadily improved. Among the changes introduced in recent years may be mentioned the progress of long distance dialling. In November 1960, the subscriber could trunk dial on the Kanpur-Lucknow line. The "Own your Own Telephone" system introduced in 1949 enabled the applicant to get a telephone on advance payment of Rs. 2,500 at Bombay and Calcutta and of Rs. 2,000 at certain specified places, being 20 years' advance payment of rent involving no further payment during this period except the maintenance and call charges. "Own your Own Exchange" came next in 1950, whereby the Department undertook to open a small exchange at any station when a loan of Rs. 50,000 at 2½ per cent interest repayable at the end of 20 years was forthcoming. Under the "Phoncom" service introduced in 1950, telegrams in Indian languages by telephone can be transmitted. The extension of trunk telephone facilities at the district headquarters and exchanges at these places having a population of 20,000 during 1954 brought the facilities of telephonic communications to places which never had them before. There are departmental testing organizations at Alipur, Jabalpur, Bombay, Bangalore and New Delhi.

In recent years, other changes designed to cater to wider public needs have been introduced. The "Shared Phone Service" by which those who have not been able to get the connection may share with an OYT (*own your own telephone*) or a non-OYT subscriber on certain prescribed rentals. Some progress has been achieved in bringing out Telephone Directories in Hindi and other regional languages. Cross-bar exchanges, now manufactured in Indian Telephones Industries, are being commissioned at an increasing number of places. As of 1969-70, about 17 places are under cross-bar installation. Telegraph service in *Devnagri* script has been extended to more and more offices, the total number as on December 31, 1969 being 3,444. Teleprinter Exchanges (Telex), first introduced in the country on a nation-wide basis in June 1963, with the simultaneous commissioning of 200 telex lines at Delhi, Calcutta, Bombay and Madras, have been extended to other places. Telexes have, during 1960-70, increased to 27, with an installed capacity of

6,560 lines. International Telex service, direct and switched, has been extended to a steadily increasing number of foreign countries. From 1,140 calls in 1960-61 the number has gone up to about 155,000 in 1968-69 and from 12,000 minutes to well over a million during this nine-year period. New trunk telephone exchanges are being opened, and point-to-point subscriber trunk dialling introduced on new routes. The aim is to facilitate national subscriber dialling. New micro-wave relay systems are being established. Other facilities, such as, long distance postal call offices, standard application form to expedite processing of applications for connections, the measured rate system for local calls, leasing of wireless links, services on special occasions to coastal station to rescue operations to ships in distress at sea — indicate the extensive range of activities of the Department.

**Manufacture of Telephone Equipment:** With a view to attaining self-sufficiency in telephone equipment, the Indian Telephone Industries was set up in 1948 as a Government undertaking under a 15-year agreement with the Automatic Telephone and Electric Co. Ltd., Liverpool. At the end of the Second Plan, the production of exchange lines increased from about 50,000 to 120,000, besides transmission equipment worth about Rs. 64 lakhs. At the end of the Third Plan, the production of exchange lines was expected to increase to 100,000 and to 160,000 telephone instruments along with a substantial expansion in the transmission equipment. Actually, by 1967-68, the production of Indian Telephone Industries amounted, under automatic exchange equipment, to 216,000 telephones, 658 multiple racks, 961 miscellaneous racks, 42,286 small exchange lines, 58,600 switches and 23,000 relay sets. Under transmission equipment, the production in 1967-68 made progress and, during the year, several new items were also taken up for production. The sales amounted to Rs. 20 crores. The company made a profit of Rs. 153.29 lakhs after providing for taxes. The undertaking also entered the export market in respect of sale of equipment to a number of countries.

**Teleprinter Production:** The Hindustan Teleprinter Factory was started in December 1960 with the Government holding all the shares and with Italian collaboration, namely, with Messrs. Olivetti of Italy. Production of teleprinters reached 3,800 by 1967-68, the indigenous content being steadily increased to 84 per cent of the bought out components of major parts. The expansion programme now envisages a production capacity of 8,500 units by 1970-71 as compared with the earlier target of 1,300 teleprinters by the end of 1963-64. The manufacture of *Devnagari* teleprinters has been started and the first batches had been released for use in July 1968.

**Overseas Communication Service:** Prior to the Government of India taking over, the external communication services were under the India Radio and Cable Communications Company, itself being the successor of the Cable Companies operating in India since 1870. The Overseas Communication Service was constituted as a nationalized undertaking under a Director-General with headquarters at Bombay on January 1, 1947. With a network then consisting of two submarine cable telegraph services, five radio telegraph services, one radio telephone service to U.K. and a restricted radio-telephone service to U.K., India was primarily dependent upon London as the clearing house for most of her overseas telecommunications traffic.

There has been considerable expansion since then. By the end of the Second Plan, India had, through 25 wireless telegraph, 25 radio-telephone and 12 radio-photographic services, established direct radio contacts with 28 countries.

The service, with its four gateway centres at Bombay, New Delhi, Calcutta and Madras, handles the submarine telegraph cable system from Bombay and Madras and the radio-telegraph and radio-telephone systems from all four centres. The submarine telegraph cables are owned and maintained by Messrs Cable and Wireless, London. By switched service, these direct connections with the international trunk routes are available with practically all countries of the world. Radio-telephone is also available *via* London to a number of ships of British, American and other foreign registries. It has also provided other services, such as multi-address broadcasts for Indian diplomatic posts abroad, news transmission services from Bombay for press, leased telegraph channels for long-distance radio-typewriter to private customs and the international telex service, enabling the subscribers in Bombay to have immediate teleprinter connection with another in the U.K. or any one of a number of other countries. Radio-photo services are available with 28 countries.

The financial results of working and traffic of the Overseas Communication Service are summarized in the following Table.

**TABLE XXXVIII**  
**Financial Results and Traffic of the O.C.S. for Select Years**  
(In thousands)

| <i>Year</i> | <i>Gross Revenues</i> | <i>Net Profit</i> | <i>Capital Assets</i> |
|-------------|-----------------------|-------------------|-----------------------|
|             | <i>Rs.</i>            | <i>Rs.</i>        |                       |

| est. 1968-69 | 3.39                  | 108.00 | ..                     | ..                      | 155.00               | 1,080.0 |

The growth in demand for overseas tele-communication facilities in India has reached proportions which cannot any longer be met by conventional HF radio facilities. India has, therefore, to provide herself with modern facilities like wide band micro-wave communications *via* satellites. India has joined the international consortium of nations set up for installing a global communication satellite system. India's share of capital participation in this consortium is one half of one per cent. Plans are in progress to establish an earth station at Arvi, near Poona to utilize communication satellite facilities when they become available to this part of the world.

TABLE XXXIX  
Growth of Postal and Telecommunication Services from 1957-1962

|                                                                | 1856-57 | 1913-14 | 1948-49 | 1956-57 | 1964-65   | 1965-66   | 1966-67   | 1967-68   | 1968-69   |

## CHAPTER X

# TRADE AND COMMERCE

### I. Inland Trade

The size of the total market is in modern economic literature regarded as an important determinant of economic progress just as the share of the market of each unit determines its survival value. Thus value and quantum of trade — foreign as well as domestic—provide a major parameter of economic strength, actual and potential. Even in large countries with a well-knit transport and communication system with the outside world, inland trade is generally much greater than international trade which touches a comparatively few commodities and a relatively small portion of them. In the case of the United States of America, for instance, inland trade has been calculated over a decade to be about ten times foreign trade. In India's case, where production is largely for home consumption, and communications with the world outside are few, domestic trade must be relatively more important, though qualitatively foreign trade would be more significant because of its ability to supply a vast range of goods not produced in the country. But even here for exports, domestic production must provide the base of an export strategy which must have a "surplus" over domestic needs in order to endure.

We may begin our discussion with the size of India's inland trade. It may be best to begin with a definition in view of the terminological confusion that surrounds the subject. Inland trade may be taken to include all exchanges that go through the money mechanism. In this sense, it can be said to be fairly measured by the total money transactions in the country. In any worthwhile sense, however, transactions pertaining to the same goods in the same form should not enter more than once, only because they change hands twice or thrice from the producer to the consumer. To be on a comparable basis with foreign trade, once the value of one commodity used as input is taken into account, only value added should be calculated later, and both exports and imports should be excluded.

Unfortunately no reliable estimate of such trade is available. In 1921, K. T. Shah made an estimate of total inland trade of Rs. 2,500 crores compared with Rs. 550 crores of foreign trade. The year 1921 can, however, hardly be called a normal one. A substantial portion of our food and other rural production is for self consumption or exchange in kind; and this portion must be excluded from trade estimates. The estimated size of inland trade for the National Planning Trade Sub-

Committee was Rs. 6,000 crores for 1925-29 (excluding Burma and Indian States). The sub-committee on trade thought this estimate should be raised to Rs. 7,000 crores to allow for the trade of Indian States. The estimate was for the total turnover. A more accurate estimate of the upto-date trade comparable with exports would be about Rs. 17,500 crores — about fifteen times the export trade\*. This higher figure considerably underestimates the real change that has taken place in the interval due to difference in the method used.

While statistics of the aggregate value of inland trade have certain uses, much more important from our viewpoint would be the composition and the direction of this trade, their behaviour over time, and break-up into rural-urban, and regional-interregional. No such overall figures are available. What is available is scattered information regarding some types of movement of goods. Statistics regarding rail movement are available, a great spurt in the total goods' traffic by weight. Value figures cannot be obtained. Indian Railways carried 93.0 million metric tonnes of goods in 1950-51; by 1968-69 the goods carried had increased to 204.0 million metric tonnes — an increase of 119.4 per cent in about two decades. Figures of rail movements of principal commodities showed a similar upward trend, the increase being most marked in case of cement, iron and steel, iron and other ores, and paper and paper-boards. The rail movements of oil-seeds, vegetable oils, cotton manufactures jute, and jute manufactures and tea declined or remained stagnant (Table I).

TABLE I

Movement of Principal Commodities by Rails 1950-51, 1960-61 and 1968-69

| Commodities               | Railway Movement<br>(in '000 tonnes) |         |         | Percentage of rail<br>movement to production |         |         |
|---------------------------|--------------------------------------|---------|---------|----------------------------------------------|---------|---------|
|                           | 1950-51                              | 1960-61 | 1968-69 | 1950-51                                      | 1960-61 | 1968-69 |
| Coal                      | 30,811                               | 50,396  | 68,638  | 94.2                                         | 95.8    | 91.6    |
| Cement                    | 2,471                                | 6,548   | 9,397   | 93.1                                         | 83.5    | 78.7    |
| Iron and steel            | 2,750                                | 7,588   | 9,652   | 146.2                                        | 138.2   | 128.1   |

| Vegetable oils            | —                                    | —       | —       | —                                            | —       | —       |
| Sugar                     | 933                                  | 1,488   | 775     | 82.3                                         | 49.1    | 21.8    |
| Raw cotton                | 525                                  | 536     | 473     | 71.4                                         | 45.1    | 43.8    |
| Cotton manufacture        | 472                                  | 380     | 269     | 81.0                                         | 38.3    | 22.0    |
| Raw jute                  | 470                                  | 644     | 677     | 78.9                                         | 86.6    | 114.4   |
| Jute and jute manufacture | 271                                  | 263     | 278     | 31.9                                         | 24.3    | 25.6    |
| Salt                      | 1,576                                | 1,981   | 2,728   | 59.2                                         | 57.7    | 54.1    |
| Tea                       | 265                                  | 250     | 260     | 95.0                                         | 77.9    | 77.2    |
| Paper and paper-boards    | 193                                  | 442     | 795     | 92.8                                         | 99.3    | 103.4   |

\* The national income for 1967-68 is estimated at (current prices) Rs. 27,900 crores. Consumption not entering into exchange may be placed roughly at Rs. 9,200 crores. The remaining may be compared with the exports of Rs. 1,200 crores.

More recent figures are available only for wagons loaded. They show a similar trend for most of the common commodities. Iron ore movements show the largest increase. The wagons loaded of cement, pig iron, iron and steel, and grains and pulses also have considerably increased. On the other hand, movements of raw cotton and cotton manufactures show a decline (Table II).

TABLE II  
Number of Wagons Loaded by Commodities

| Commodities                   | Broad Gauge |         |         | Meter Gauge |         |         |
|-------------------------------|-------------|---------|---------|-------------|---------|---------|
|                               | 1951-52     | 1960-61 | 1968-69 | 1951-52     | 1960-61 | 1968-69 |
| Coal and coke                 | 1,145       | 1,337   | 2,176   | 207         | 254     | 338     |
| Grains and pulses             | 358         | 455     | 565     | 268         | 382     | 375     |
| Oil-seeds                     | 50          | 59      | 60      | 51          | 71      | 61      |
| Raw cotton                    | 35          | 30      | 26      | 26          | 22      | 24      |
| Cotton manufactures           | 24          | 13      | 6       | 13          | 3       | 1       |
| Raw jute                      | 43          | 56      | 67      | 42          | 60      | 48      |
| Jute manufactures             | 6           | 8       | 10      | 5           | 7       | 8       |
| Sugar                         | 38          | 55      | 31      | 59          | 73      | 35      |
| Sugarcane                     | 79          | 65      | 25      | 189         | 227     | 118     |
| Cement                        | 102         | 213     | 320     | 69          | 188     | 230     |
| Pig iron                      | 14          | 50      | 63      | 6           | 6       | 7       |
| Iron and steel (others)       | 117         | 260     | 360     | 22          | 57      | 53      |
| Tea                           | 10          | 13      | 17      | 27          | 19      | 20      |
| Manganese ore                 | 49          | 58      | 50      | 11          | 21      | 15      |
| Iron ore                      | 146         | 446     | 904     | 8           | 75      | 85      |
| Other ores                    | 2           | 12      | 55      | 3           | 22      | 11      |
| Total number of wagons loaded | 4,230       | 6,164   | 8,557   | 2,607       | 3,593   | 3,692   |

Estimates of the volume of traffic carried by road vary widely according to the assumptions made and the organizations attempting them. For instance, the ton miles performed in 1958-59 by commercial road transport were estimated at 8,500 millions by the Secretariat of the Committee on Transport Policy and Co-ordination, at 12,800 millions according to the data given by the Indian Roads and Transport Development Association and 17,400 millions on the assumptions indicated by the Railway Board. It is, therefore, difficult to say anything precise on the point. The only firm data are the number of trucks registered in India which show an increase between 1948-49 and 1968-69 — from 73 thousand to 301 thousand. The trucks numbered 82 thousand in 1950-51. According to the estimates of the above Secretariat, road transport carried 11 per cent of the total tonne kilometres moved in 1948-49; in 1968-69 the share increased to about 24.2 per cent. Since relatively more of the road traffic is of high-priced goods and for short distances, the proportion of goods carried by roads to the total movement by rail and road by value must be greater.

Statistics of inter-block trade by rail and steamer are available in a long time series; figures of trade within the bloc are not unfortunately available. Break-down by certain important commodities can also be obtained. These, however, partake of the nature of international or inter-regional trade statistics where the creation of new States or amalgamation of existing States vitiates the series. The trade blocks are mostly based on political boundaries. The changes in the number and boundaries of the States that have taken place since independence have, therefore, made these figures non-comparable over years. For example the earlier figures pertained to 22 principal blocks, we have now 31 blocks of which 9 are port blocs (Andhra ports, Bombay, Calcutta, Cochin, Goa, Madras port, other Madras ports, Pondicherry and Saurashtra ports). Exports from these ports by rail are often re-exports of foreign goods, and imports into them are for export abroad. The port figures have, therefore, to be interpreted after taking into account the foreign trade through them. The annual figures show in all major commodities — agricultural, mineral and industrial — a great inter-dependence. Many manufactured and other commodities are, however, not included in this series; and the absence of value figures makes it impossible to draw any balance of trade picture for the blocks (Table III).

TABLE III

| <i>Commodities</i>                                   | <i>Major exporting trade blocks</i>                                              | <i>Major importing trade blocks</i>                                                                                                                 |
|------------------------------------------------------|----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Rice (not in hush)                                   | Ports (Andhra, Cochin, Calcutta), West Bengal, Punjab, Orissa, Tamil Nadu.       | Ports (Calcutta, Tamil Nadu, Cochin), Andhra, Kerala and Maharashtra.                                                                               |
| Wheat                                                | Ports (Andhra, Gujarat, Cochin, Tamil Nadu, Bombay, Calcutta), Punjab.           | Andhra Pradesh, Assam, Bihar, Delhi, Gujarat, Madhya Pradesh, Tamil Nadu, Maharashtra, Karnataka, Punjab, Rajasthan, Uttar Pradesh and West Bengal. |
| Jute raw                                             | Assam, Bihar, West Bengal.                                                       | Calcutta Ports and West Bengal.                                                                                                                     |
| Raw cotton (lint) (Indian and foreign)               | Rajasthan, Punjab, Karnataka, Maharashtra, Madhya Pradesh, Gujarat.              | Uttar Pradesh, Tamil Nadu, Gujarat, Andhra Pradesh, and Bombay port.                                                                                |
| Cotton piecegoods                                    | Gujarat, Madhya Pradesh, Maharashtra and Bombay port.                            | Bihar, Madras, Uttar Pradesh and Calcutta and Tamil Nadu ports.                                                                                     |
| Coal and Coke                                        | Bihar, Madhya Pradesh, Maharashtra, Orissa and West Bengal.                      | Andhra Pradesh, Delhi, Gujarat, Tamil Nadu, Karnataka, Rajasthan, Uttar Pradesh and Calcutta port.                                                  |
| Iron and steel bars, sheets, girders and other forms | Bihar, Madhya Pradesh, West Bengal, Orissa, Punjab and Calcutta ports.           | Andhra Pradesh, Assam, Delhi, Gujarat, Tamil Nadu, Maharashtra, Uttar Pradesh and Calcutta, Bombay and Madras ports.                                |
| Oil-seeds                                            | Andhra Pradesh, Gujarat, Maharashtra, Madhya Pradesh, Punjab, and Uttar Pradesh. | Bihar, Tamil Nadu, West Bengal and Bombay, Calcutta ports.                                                                                          |

| Sugar (including <i>Khandsari</i> )                     | Andhra Pradesh, Bihar, Maharashtra, Uttar Pradesh.              | Gujarat, Madhya Pradesh, Rajasthan, West Bengal and Bombay and Calcutta ports. |
| Sugar — raw ( <i>Gur</i> , jaggery and <i>Shakkar</i> ) | Andhra Pradesh, Punjab, Maharashtra, Uttar Pradesh, Tamil Nadu. | Gujarat, Rajasthan and Calcutta ports.                                         |

The defects of inland trade statistics have been widely commented upon and were ascribed before independence to the indifference of foreign rulers to internal trade. This reasoning no longer holds good but deficiencies largely persist.

## II. Evolution of Foreign Trade

**Evolution before Independence:** Since the dawn of civilization, India seems to have been eminent in the field of foreign commerce. The diversity, quantity and prosperity of this trade were the envy and admiration of the world, but judged by the present standard the quantum would no doubt appear insignificant. The international division of labour then showed India to be comparatively very developed. In earlier periods India seems to have exported manufactures like fine cotton and silk textiles, iron goods, wooden goods, ivory work, precious stones and indigo, and imported gold and raw materials like silk, metals, etc. Great Britain in its early years of the Industrial Revolution found it necessary to protect many of its new manufactures against imported Indian products. This was indeed a great tribute to the comparative stage of artistic and technical excellence that India had reached.

Modern Indian foreign trade may be said to have made a firm start in 1870, after the opening of the Suez canal, the rapid development of the shipbuilding industry, the spread of Industrial Revolution in Europe the opening of the Indian railways and the firm establishment of peace and order in India after the chaos that had followed in the wake of the break-down of the Mughal system of administration. Indian foreign trade in this period had three distinguishing characteristics — the importance of raw materials in exports and of manufactured goods in imports, the overwhelming importance of the U.K. as a supplier of imports and only a little less so as a market for exports and a favourable balance of trade. These characteristics continued to mark Indian foreign trade for seven decades, though in a modified form. Total foreign trade increased in value at an annual compound rate of 4 per cent.

### Percentage increase in trade over previous decade

|                      |       |
|----------------------|-------|
| 1879-1980 to 1888-89 | 46.1% |
| 1889-1990 to 1898-99 | 22.9% |
| 1899-1900 to 1908-09 | 44.7% |
| 1909-1910 to 1918-19 | 49.3% |
| 1919-1920 to 1928-29 | 51.1% |

The above position continued till the Great World Depression intervened and changed almost all the earlier features of world trade; the quantum growth, though lower, was satisfactory.

Indian trade expanded at a faster rate than the trade of many developed nations in the period prior to the First World War, but afterwards its relative performance was less satisfactory. Different groups of commodities naturally participated in this increase in different proportions. Manufactured imports increased less than imports of raw materials, a first indication of more rapid industrialization. Exports of manufactured goods also advanced at a higher rate than those of raw materials, though the change was not as significant as in the case of imports, for it was to the domestic market that new production, particularly textiles, was largely directed.

TABLE IV  
Annual Percentage Increase of Exports and Imports  
of Raw and Manufactured Products

|                      | <i>Between</i>   | <i>Annual percentage increase<br/>Between</i> | <i>Between</i>        | <i>Between</i>         |
|----------------------|------------------|-----------------------------------------------|-----------------------|------------------------|
|                      | 1879<br>and 1892 | 1892<br>and 1907                              | 1906-7<br>and 1912-13 | 1912-13<br>and 1927-28 |
| Manufactured Imports | 2.8              | 6.2                                           | 15.3                  | 3.0                    |
| Raw Imports          | 6.5              | 8.5                                           | 26.0                  | 6.0                    |
| Manufactured Exports | 15.0             | 9.3                                           | 7.3                   | 3.3                    |
| Raw Exports          | 3.0              | 3.8                                           | 3.8                   | 2.5                    |

The same tendency was manifest during the Depression, Recovery and War periods.

These transformations were welcome to Indian opinion. Because of the diversity of its resources, its size and its development, the index of export dispersion in India was much higher than that of other similar underdeveloped economies. The foreign trade of India thus began to reflect the economic structure of an industrializing country. Both export and import trade became less dependent on Great Britain; Germany, the U.S.A. and Japan participated in the share thus released. In the five years ending 1869-70, U.K. accounted for 53.2 per cent of our exports and 73.7 per cent of imports. Table V indicates the broad change since 1901.

During the depression, due to peculiar circumstances, U.K. partially gained the lost ground, but this was a special phenomenon likely to be reversed soon. In this long period involving the First World War and the Great Depression, most of the years were characterized by heavy export surpluses. There were only two years marked with trade deficit, 1920-21 and 1921-22 and a few years of small surpluses. While a part of the export surplus was necessary to meet the deficit on invisible account including "Home Charges", a substantial surplus remained even on current account and except in the thirties, imports of precious metals

| Japan          | 1.0                      | 2.5  | 19.8 | 6.9  | 10.5 | 17.0 | 2.0                      | 7.7  | 12.1 | 10.4 | 8.9  | 15.3 |

could be financed from this. Modern planners would look back with envy on this feature, which might have been utilized for imports of capital goods to accelerate industrialization if there had been a real will directed to that end.

In judging this period and comparing it with later ones, there is one special feature of this period that should be remembered. Throughout this period, with the exception of the First World War, free multi-lateral trade prevailed. It was such an article of faith with the British rulers that they carried it to a ridiculous length in the matter of cotton import duties, when they insisted on lowering the small revenue duties on imported cotton yarn and manufactures, and countervailing them by excise duties. This article was haltingly departed from with the policy of discriminating protection laid down by Indian Fiscal Commission. More important departures were necessitated by the policies followed all over the world in the depression which led in India to the adoption of the Imperial Trade Preference and the Trade Agreements with U.K. and Japan. But even during this period, direct controls either on the commercial or exchange side were infrequent, and the discrimination practised was mild. The trade developments of the period can, therefore, be truly described as the results of free trade policies.

The Second World War changed greatly the quantum, composition and direction of Indian foreign trade. Owing to shipping shortages, non-availability of goods abroad, cessation of trade with enemy and enemy-occupied countries (whose number increased with the course of war) etc., the quantum of imports declined sharply, even though our willingness and ability to pay for imports increased. Some of these adverse factors also operated on the export side, but the allied demand for defence and other essential goods was insatiable, and India's capacity to export was strained to this end. The export quantum, therefore, decreased less. Exports at their lowest level in 1943-44 were more than half the 1938-39 level; imports fell in 1942-43 to two-fifths of the pre war level. Exports of textile manufactures — cotton and jute, greatly increased, while exports of raw cotton shrank. On the import side, raw materials and semi-manufactures, especially cotton and mineral oils, increased in importance; imports of machinery, iron and steel and cotton manufactures declined. Trade with Western Europe (excluding U.K.) and Japan ceased; and their place was taken up by the U.S. The British Empire became a more important purchaser of Indian goods. These changes were, however, the results of war-time circumstances and carried within themselves the seeds of their reversal. During the war, the Indian economy had been greatly starved both of consumption goods and capital goods, and there was a large pent-up demand for imports. Individuals and businesses had accumulated surplus liquid funds, which

could be utilized for purchases from abroad. In the case of Railways and many other industries, an urgent rehabilitation programme was essential. Even after the end of the war, however, owing to world scarcity of goods, competing claims of reconstruction from all over the world, dollar scarcity, and inconvertibility of sterling balance, the return to normalcy was likely to be postponed. As these limitations disappeared one by one, war-time trends were likely to be reversed, and after an initial period of adjustment and adverse balance of trade, a new and more normal pattern was likely to emerge.

**Evolution after Independence:** As it happened, however, before things could settle down to normal, important political events intervened which placed persistent pressure on India's balance of payments. In August 1947, two years after the cessation of war, came partition and independence. Hitherto, India and Pakistan had been one country, and trade between them had developed unhindered. Their economies had become highly inter-dependent. India produced most of the manufactured cotton and jute goods, while Pakistan supplied 73-80 per cent of raw jute and 40 per cent of cotton required by these industries. West Pakistan having a larger proportion of irrigated land was surplus in foodgrains, and though the Eastern part (now Bangla Desh) was deficit, on the whole Pakistan had a small surplus which went to alleviate the substantial food deficit of undivided India. Pakistan, on the other hand, used to purchase coal, cement and a variety of other manufactured goods from India. Table VI showing trade between India and Pakistan gives a broad idea of the division of labour that had developed.

TABLE VI  
India's Trade With Pakistan 1948-49  
(in crores of rupees)

| <i>Imports</i>                 |        | <i>Exports</i>                                              |       |
|--------------------------------|--------|-------------------------------------------------------------|-------|

Partition was bound to have in due time important effects on the course of Indo-Pakistan trade, apart from the purely statistical effects that would ensue because of changing a part of the formerly internal trade into foreign trade. Pakistan was likely to pursue a vigorous policy of industrialization, even as India had done earlier, and naturally the industries it would think of developing first would be the simple jute and cotton textile industries, for which the raw materials were being domestically produced in abundance, thus reducing the exportable surpluses of these raw materials. On the Indian side, the scarcity of foreign exchange and the decrease in Pakistani demand for Indian manufactured goods would lead to a policy of import substitution in respect of raw cotton and jute. But given understanding and willing acceptance of the consequences of the new situation the process could have been more gradual, and the transition could have been made smoother by suitable agreements. This would also have helped the quicker development of both countries. Unfortunately, the atmosphere in which partition was agreed to and the events which followed in their wake vitiated the climate for such an agreement. When India devalued in 1949, and Pakistan did not, raw jute prices raised all the difficulties connected with the determination of a fair and equitable price under bilateral monopoly. The views of both sides so conflicted that a trade war ensued, and legal trade was confined to a trickle in spite of many efforts made to arrive at satisfactory trade agreements. Imports from Pakistan declined to Rs. 44 crores in 1949-50 and exports to Rs. 40 crores. This put an additional strain on the Indian economy.

The year 1947 witnessed another major difficulty for India. The 1946 U.S. loan of \$3,750 millions to the U.K. was exhausted by September, 1947, much earlier than anticipated without doing any perceptible benefit to the British economy and exchange control all over the sterling area was tightened. As a measure of alleviating the strain on the balance of payments, England and many other members of the sterling area including India devalued in September, 1949. Though it was a protective devaluation meant only to safeguard the export position *vis-a-vis* other members of the sterling area, it had the effect of increasing the value of Indian exports. Import control was so tightened that imports diminished even in terms of rupees. The Korean War boom gave a brief welcome upward thrust to exports, through changes in export prices. Imports were liberalized but owing to scarcity of goods they did not show a substantial increase till 1951-52 when they reached the peak of Rs. 979 crores.

On January 26, 1950, India was declared a Republic. One of the first major steps taken by the Government was the setting up of a Planning Commission and the adoption of Five-Year Plans to increase the

tempo of economic development and the more equitable distribution of its fruits. It took some time for the impact of the Plan to be felt on foreign trade. But by the second year of the Second Five Year Plan, 1957-58, it led to a radical transformation in the structure of our import trade.

The aim of the First Five Year Plan was largely the restoration of the pre-war per capita standard of living though it was also aimed to build the overheads and lay the foundations for rapid progress in future. It was a modest plan of a Rs. 2,069 crores, aiming at a national income increase of 11 per cent. The next Plan was much bigger, contemplated a relatively greater investment in industries, was heavy industry oriented, and aimed at the socialist pattern of society. It visualized a public sector outlay of Rs. 4,800 crores and a national income increase of 18 per cent. The Third Plan was cast in the same mould and estimated a public spending of Rs. 7,500 crores to achieve a 30 per cent income increase in total income and 17 per cent rise in per capita income.

The three Five-Year Plans were followed by three annual Plans covering the period 1966-1969. These annual Plans involved an outlay of Rs. 6,665 crores in the public sector. The Fourth Five Year Plan covering the period 1969-1974 places the public sector spending at Rs. 15,902 crores.

The size and nature of the First Plan meant a modest quantum of developmental imports. Favourable monsoons and good food production in the later years of the First Plan reduced the need for food imports, so that foreign aid and use of sterling balances were minimal. The draft on foreign reserves was only Rs. 127 crores as against the estimate of Rs. 290 crores. Net long-term private and official capital and official donations accounted for only 8 per cent of the exchange receipts and 10 per cent of Plan expenditure. With increases in public and private investment, however, developmental imports greatly increased. By the middle of the Second Plan, the demand for imports had so greatly increased that in spite of using up the available foreign exchange reserves and generous foreign aid amounting to 24 per cent of Plan outlay, not even the Plan or developmental imports could be permitted, and foreign exchange became a severely limited factor on the progress of the Plan. The rapid industrial progress and the import-substitution programmes launched since then have not helped the position substantially. Throughout this period, India had to maintain a delicate balance between the natural desire to permit the imports essential for achieving the Plan target (and the foodgrain imports required to feed her teeming millions), and the need to live within the bounds of foreign exchange receipts on current and long-term capital account (Table VII).

TABLE VII

## Foreign Trade of India Value and Quantum

(Rs. in crores)

\*Includes re-exports.

\*Excludes land trade with Afghanistan and Iran.

## III. Analysis of Foreign Trade

**Exports:** Since the exports were less affected by restrictions than imports, one may begin with a brief account of how they fared. The great scarcities immediately after the end of the Second World War led India to resort to export quotas and duties to maintain domestic supplies and contain inflation. Destinalional export quotas were laid down to encourage exports to hard currency areas. The fear of the domestic consequence of devaluation and the Korean export boom strengthened this restrictive tendency. Nevertheless, the boom had a stimulating effect on exports, whose quantum increased from 92 in 1948-49 to 105 in 1950-51. In 1951-52, exports fell below 1948-49 level, but the export price index increased to 142, leading to the record export earnings of Rs. 733 crores. The First Five Year Plan document devoted some thought to the need for increased exports, and provided for substantial increases in production of certain export crops like oil-seeds. It was estimated that by the end of the First Five Year Plan exports would rise by 10 per cent over the already high 1950-51 level and 30 per cent

over a 1948-49. Compared with the later period cotton piece-goods, manganese ore, coal and coke, and coir exports were expected to double or even do better. Exports, however, reached the 1950-51 quantum only in 1954-55 and in value terms in 1955-56 (1951-52 as noted above was an exception for the value of exports).

The Second Five Year Plan began with a happier domestic situation with many export controls removed and little need for discrimination in export supplies. It was only with the exchange crisis in 1957-58, that the need for increasing exports was greatly felt. It was realized that imports could not be further appreciably curtailed without hampering development, and the prospects of aid to cover the entire gap between the export earnings and the payments for imports needed for maintenance and development at a satisfactory rate were remote. Export promotion committees were appointed, and according to their recommendations export duties were removed or reduced, restrictive export quotas largely eliminated and provision made for rebate or drawback of import duties on raw materials and components used in manufacture of export goods. Railway freight concessions were given for some items, import facilities provided and certain concessions given in direct taxes. Export Promotion Councils were set up for important export commodities and in some cases Commodity Boards were entrusted with the function of export promotion. Emphasis was laid on the need to diversify export trade by exporting new manufactures in engineering goods, chemicals, plastics etc. Certain institutional changes like the State Trading Corporation, bilateral trade treaties and rupee payment agreements were attempted. Their total effect during the Second Five Year Plan was negligible. The average value of exports in the period were about the same as in the earlier Plan period, including 1951-52. In terms of quantity, there was an increase of 10 per cent.

The Third Five Year Plan commenced with a recognition of the urgent need for export increase. On very conservative estimates, financing the imports needed for the fulfilment of a Rs. 10,000 crore overall investment programme required average additional export earnings of Rs. 150 crores a year and foreign aid of Rs. 3,200 crores in the five-year period (including PL 480 imports). Since actual requirements exceeded calculated needs and all sorts of emergencies calling for increased imports were likely to arise, the urgency for increased export promotion could not be gainsaid. As it was, the conflict with China that occurred soon after upset the import requirement calculations. During this period, a Ministry of International Trade was set up and a Board of Trade was formed. A vigorous export incentive scheme was launched. For the first time, exports began to pick up.

The composition of exports has undergone only small changes during

the planning period, jute manufactures, cotton manufactures, and tea continued to account for 45-50 per cent of the total export earnings. Vegetable oils, oilcakes and oil-seeds, hides and skins, spices, cashew kernels, tobacco and raw cotton were responsible for another 1/5th of exports. Jute exports and tea occasionally changed first places, but cotton exports almost always remained third. Two new groups of commodities emerged as important export commodities — ores and minerals and engineering goods. Iron ore exports were negligible in 1950-51. They amounted in the First Plan period to Rs. 21 crores and in the Second Plan to Rs. 62.6 crores. In 1963-64, they accounted for Rs. 36 crores of exports. The first group owes its significance to the increasing steel production in the world, and the foresight of the State in entering into new trade agreements with Japan. The second is symbolic of the type of potential export commodities in which future India will come to excel (Table VIII).

**Imports:** While exports have been mainly dependent on world demand and very imperfectly amenable to domestic policy measures, imports have been largely a matter of Government policy. The available export earnings and the foreign exchange that could be obtained in other ways have put a ceiling to the imports that could be obtained. Within this ceiling the demand for foodgrains imports had to be first accommodated. Though there was some talk of saving foreign exchange through reducing foodgrains imports by rationing and other measures to curtail food demand, so far the size of foodgrains imports has been largely dictated by the size of domestically available foodgrains and the need to contain foodgrains prices. Fortunately, in the latter part of our period this imperative need has not meant a large drain on valuable foreign exchange as additional food imports were largely covered through PL 480, which, whatever its other drawbacks, meant no immediate foreign payments nor implied a reduction in the quantum of other foreign aid. Imports other than food can be influenced by policy decisions, though maintenance imports will command some priority. In the First Plan, imports were only liberally controlled, but they remained at a comparatively low level, the maximum being Rs. 979 crores reached in 1951-52. The really great spurt in imports was in 1957-58 when it reached the record figure of Rs. 1,036 crores. Import controls had again to be tightly clamped. As time went by and scarcities began to be felt, more imports had to be allowed and imports reached the still higher level of Rs. 1,045 crores in 1960-61. Of the two sectors, imports on Government account showed bigger fluctuations, partly because foodgrains were brought from outside on Government account. In the first year of stringent import controls, 1958-59, Government imports exceeded private imports though for the Second Plan period as a whole they formed

two fifths of total imports. In the first year of the Third Plan imports slightly declined but again picked up in the two later years. Import quantum declined only in 1958, but then showed an increase.

There is one interesting point in connection with the behaviour of Indian imports. Since India had stringent import control regulations and there were no rigid compulsions about imports except food, one would have expected some regularity in their behaviour in relation to the import capacity. One would not be prepared for sudden and unjustified use of reserves, nor quick changes in import policies except those following export receipt or aid changes. In the case of India, however, inability to use sterling balance withdrawal facilities or their use at a rate much greater than that provided for was common. Table IX illustrates this point.

In many cases it is the import policy changes that have led to these situations. After 1957-58, however, with the reduction of sterling balances to the minimum safety level, import control was compelled to be more consistent. But a heavy price had to be paid for this late realization; in spite of increase in import quantum both developmental and maintenance imports had to be sharply curtailed with adverse consequences on the rate of growth or the smooth running of the Indian economy.

The thirteen years of planning have been marked by significant changes in the composition of imports. Capital goods showed a three-fold increase in 1963-64 over 1950-51, and formed 42 per cent of the total imports as against 26 per cent at the start. In this group, iron and steel imports increased more than four-fold. Consumption goods retained their relative importance mainly due to increase in foodgrains and electrical goods. Many other developing countries show the same characteristics, but the Indian scene has also been marked by imports, as a result of the successful import substitution programme in raw jute. They declined from 33 per cent in 1950-51 to 17 per cent in 1963-64 and further to about 15 per cent by 1968-69. Mineral oils greatly increased in importance, and chemical imports increased to four-fold, but jute imports almost disappeared.

The above classification of imports does not fully indicate the nature of the transformation of the economy, and the efforts made by the country in this regard. Raw materials and intermediate goods may be imported for different end-uses, for increasing consumption or for increasing investment. Imports of consumption goods may be either for sustenance or nourishment or enjoyment. To bring this out better the Economic Commission for Asia and Far East classifies imports into five categories — (a) consumption goods: food; (b) consumption goods other than foods; (c) materials chiefly for consumption goods; (d) materials chiefly for capital goods, and (e) capital goods. Classifying

Indian imports into these categories it is found that with 1941-44 base as 100, while total imports in 1958-60 increased by 26 per cent, capital goods' imports increased substantially by 113 per cent. Materials for capital goods fared the next best — 86 per cent increase. A slight decrease was experienced in materials for consumption goods — 7 per cent. Food imports declined by one-fifth and other consumption goods by one-fourth. The change in the pattern of imports will appear far more significant if imports in 1968-69 are compared with those of the First Plan period, (Table X).

**Direction:** Indian export trade shows few directional changes except by way of reversal of war-time trends. Germany and Japan, especially the latter, once more become important markets for Indian goods. Ore exports have increasingly helped Indian export trade with Japan. The U.S.S.R. has acquired new importance as a purchaser of Indian goods. The shares of the U.K. and the U.S. in our exports is more or less static. Pakistan bought 15.7 per cent of Indian exports in 1948-49, its share declined to 1 per cent in 1963-64 and to nil by 1968-69.

The direction of India's import trade greatly changed in the planning period. Partly this was the consequence of the change in the commodity pattern. The increase in the relative importance of machinery and iron and steel simultaneously implied a proportionately greater increase in the relative trade with the developed countries; success in import-substitution of agricultural raw materials meant a relative shrinkage in the imports from under-developed countries. Among the developed countries, changes in competitive strength were of great significance. Both Germany and Japan made miraculous recoveries, and their economies were fast expanding. They made gains on their pre-war shares in the world trade. The U.S. captured a large proportion of world trade in the reconstruction period, but has since been losing ground. The U.S. also belonged to the group of countries whose share was declining in world trade. In both these cases, as far as India is concerned, many factors pulled powerfully in the opposite direction. Imports of developmental goods were often financed by tied aid. Since in the more recent years U.S. aid has been tied, imports from the U.S. were kept up. The commodity aid under PL 480 also had the same effect. India derived most of its food and cotton imports from the U.S. — a developed country, in this manner. The availability of sterling balances largely for use in the sterling area facilitated imports from the U.K. for the first-half of the period.

As a result of all these factors, the import trade with the U.K., specially after the Second Plan, relatively diminished in importance. The U.S. greatly increased its share from 1961-62 level. Japan also regained its place in India's import trade. In addition, the U.S.S.R. became an

TABLE X

important purchasing centre. The most striking change, however, was that the import trade with Pakistan, declined from 14.7 per cent in 1948-49 to less than 1 per cent in 1963-64 and further to nil or negligible by 1968-69 (Table XI).

#### IV. Commercial Policies

As stated earlier one very important feature of the Indian trade prior to 1939 was the *laissez-faire* policies of the Indian Government. Some of these policies had to be changed in the inter-war period. The Second World War, independence and planning brought further transformation in this sphere. As a result, the need for comprehensive State policies is now taken for granted. It is, therefore, worthwhile to examine the more important steps in this transformation at some length.

**Policy of Protection:** As a result of the experience during the First World War of the grave limitations that the existing economic structure imposed on India's capacity to adjust to varying requirements, the Government of India realized the need for adopting a State policy for promoting industrialization. An Industrial Commission was, therefore, set up in 1916 and a Fiscal Commission in 1921. The latter was asked to examine the tariff policy of the Government and to make recommendations. The commission could not produce a unanimous report; the majority report advocating discriminating protection was, however, accepted. This policy was found gravely inadequate and halting. To establish a claim for protection, an industry had generally to satisfy three conditions: (a) that the industry possessed natural advantages such as abundant raw materials, cheap power, sufficient supply of labour or a large domestic market to establish a comparative advantage; (b) that the industry was such that it could not develop at all or could not develop as rapidly as was desirable in national interests without protection; and (c) that it would eventually be able to withstand foreign competition on its own. The quantum of protection was to be decided with reference to the cost of production at home (including a reasonable profit margin) and the cost price of foreign competitors, and was expected to cover this gap.

Many important export industries securely established abroad depend on imported raw materials. They also sometimes depend on migrant labour. Unskilled labour supply was generally plentiful in India, but indigenous skilled labour supplies had to be built up by the struggling industries. For a country struggling to develop, new industries had to be started, but under this triple formulæ it became difficult for new industries to ask for protection since they could hardly furnish any satisfactory cost data. Furthermore, the Indian Industry could not derive much benefit from the scheme of tariff protection enunciated by the

(Rs. in crores)

Tariff Commission because the commission itself had enunciated a strange rule: "Not only in our view are there strong objections as a rule to granting tariff protection to new industries but the grant of such protection is really necessary."

Protection is only one of the necessary conditions for the industrialization of a country, but it is not a sufficient one. The creation of a general atmosphere for industrialization is necessary and an all-round Government policy which will promote and invigorate this climate can alone be helpful. The Tariff Board appointed by the Government of India to look into the question of protection was an *ad hoc* body, and, therefore, there was hardly any scope for accumulation of experience and building up of an efficient technique, or for detailed supervision of the protected industries. The protected industries were only periodically accountable, that is, at the time when they asked for continuance of protection. The Government of India interpreted the formulae of the Indian Fiscal Commission more rigidly than the Tariff Board and refused protection in some cases such as glass and the worsted section of the woollen industry even when the Board recommended these industries for protection. In spite of these defects, between 1921-1939 thirteen industries received protection and several of them like the cotton textile, iron and steel, magnesium chloride, paper, sugar and match industries justified the grant of protection to them. The industries continued to progress even during depression\*. It can be claimed that the policy of discriminating protection, within its limited scope, achieved a fairly large measure of success and that on balance the direct and indirect advantages to the community of protection to these major industries offset the burden on the consumers.

The Second World War saw the setting up of many new industries unhampered by any external competition. Protection to already protected industries was continued during the war. The new industries did not need any protective duties immediately, but in 1940 they were assured by the Commerce Members of the Viceroy's Executive Council that if organized on business lines, they would be adequately protected in future. As soon as the war ended and a degree of outside competition was introduced, the future of many of them became uncertain. In November, 1945, the Government set up an Interim Tariff Board for two years to investigate the claims of the various war industries seeking protection or Governmental assistance. In 1947, the Board was re-constituted for a period of further three years.

The conditions laid down for protection were more liberal viz. that (a) the industry was established and conducted on sound business lines and that (b) (i) it was likely to develop sufficiently well, within a reasonable

---

\*Report of the Fiscal Commission, 1949-50, Vol. 1.

time, so as to carry on without protection or state aid, or that (ii) it was such that protection granted to it would be in national interests and the probable cost of doing so was not excessive. There were no conditions regarding local availability of raw materials, local markets or local labour except in so far as they were essential to establish a long-term comparative advantage. The Tariff Board was, by the nature of the case, appointed for a temporary period, but it was entrusted with wider powers and responsibility to ensure that the objectives of protection were fulfilled. For instance, the Board had to maintain a continuous watch over the progress of protected industries. It could recommend measures other than tariffs and make cost and price inquiries when asked by the Government. In the five years of its life, the Board conducted ninety inquiries (including five cases of internal price fixation) as against 51 conducted in the pre-war period. Also the Government announced its decisions on the Board's recommendations expeditiously, that is, generally within a period of two months instead of 3-24 months, as earlier.

With India becoming independent in August 1947, and becoming intent on securing rapid economic progress through a planned policy of industrialization, the whole concept of protection changed. It was no longer a question of considering the requests of private parties, who wanted to start or increase production in particular industries and who thought protection would be necessary and helpful. It was more a question of the nation deciding which industries it wanted to develop as a part of its programme for economic development and using the fiscal methods as one of the devices for achieving this aim.

The Second Fiscal commission set up in 1949, therefore, formulated very different criteria for the grant of protection. The resolution setting up this commission in fact embodies this new outlook. It refers to the Industrial Policy Statement which mentions the tariff policy as being designed "to prevent unfair competition and promote the utilization of India's resources without imposing unjustifiable burden on the consumer". Further this time the whole subject of Government assistance and the obligations of the assisted or protected industries were included in the terms of reference. Industries were broadly divided into two categories — (a) those included in the Plan and (b) those not so mentioned. These two categories were treated very differently for purposes of protection. The planned industries were grouped into three main divisions — (a) defence industries and other strategic industries; (b) basic and key industries; and (c) others. If protection was necessary in the first case, it was to be given irrespective of consequences such as the cost to consumers. For the second category of industries, only the terms and conditions for grant of protection, the form and the quantum were to be laid down by the tariff authority, which was also to review from time to time whether the industries were complying with

the conditions. For the third group as well as industries outside the planning list, stringent conditions were laid down. The fundamental test prescribed was the likelihood, in light of all the facts, of the industry being able to develop its comparative advantages and eliminate disadvantages so as to carry on successfully within a reasonable time without protection. In the alternative the industry asking for protection should be one to which it was desirable in national interests to grant protection or assistance, and the probable cost of such measures should not be excessive to the community having regard to direct and indirect advantages. In the case of industries included in the approved plan, the Tariff Board was entitled to consider relaxation in conditions.

For the purpose of implementing this new policy of protection, a Tariff Commission was set up under the Tariff Commission Act of 1951. It had two principal functions — (a) to examine the case for, and recommend, protection and/or Government assistance to an industry; and (b) to recommend price levels to be fixed for the controlled commodities. The second function has come to occupy considerable importance. The Tariff Commission Act laid down the general and broad principal to be adopted in deciding tariffs, these being: (a) the cost of production in India; (b) the approximate cost of production of similar products in other producing countries, (c) the cost of importing such items; (d) representative fair selling price of the product by the domestic manufacturers; (e) the quantities of commodities to be produced or required to be produced; and (f) the likely impact of such protective measures on the rest of the economy.

In the thirteen years of its life, the Tariff Commission has done useful and arduous work. It has recommended grant of protection to 57 industries in addition to 9 that were protected earlier. Of this total of 66, 42 have been deprotected by now and in 5 cases the scope of protection has been narrowed. In 28 cases, applications for protection were rejected. Regarding the method of protection, it has gone mainly by the advice of the Indian Fiscal Commission which had expressed a preference of import duties over import quotas or subsidies, though in specific instances it recognized the need for the latter two. It stated: "We recommend that for purpose of protection to domestic industries in normal cases, quantitative restrictions should be used sparingly."

The recommendations of the Indian Fiscal Commission were, however, based on certain assumptions regarding general economic conditions and Government policy. In their scheme of things no long-term detailed Government economic policies based on industrial licensing and rigid import control seem to have been envisaged. They thought of the planning authority as only laying down a list of industrial priorities. The Tariff Commission was to accept in full the need for protecting key and basic industries and confine itself to the question of the most effi-

cient and least burdensome method of helping them, but in the case of other industries it was also to examine and fill in the details in so far as they needed Government help. Acute foreign exchange scarcity was not visualized and therefore, the implications of detailed exchange allocations were not allowed for.

The circumstances have since changed. The quantitative import controls, which have now become an integral part of the situation, have deprived their recommendations of much relevance. It is the use of import controls which now decides the presence and extent of foreign competition in the Indian market. There is a wide disparity between the landed price (including import duty) of foreign goods and the similar price of a competing home-produced good; and the disparity is as much in the case of protected industries as elsewhere. The import licences in policy materially decides the level of protection that the domestic industries will enjoy. In so far as this is not accidental, it is largely dependent on the decisions taken by the industrial licensing authorities, and on the units of production already established in the country. The domestic production of the latter is taken into account in allowing imports; they, therefore, automatically get protection. Competing foreign goods are generally allowed to the extent necessary to fill in the gap between domestic demand and domestic supplies. The role of Tariff Commission has thus become a minor one. Its quasi-judicial nature, its procedure of public inquiries and the need to submit detailed reports which are published, all represent a very valuable safeguard which is now of little use to the nation. In very few cases, the protection recommended by them and adopted by the Government represents the quantum really enjoyed by the industry. At most it only defines the minimum margin that the industry would be entitled to, if the foreign exchange situation improved and the imports could be liberalized. Till then, industries have to struggle to get the industrial and import licences, but their difficulty is not, generally speaking, foreign or even internal competition, but scarcity of raw materials or intermediate goods. It is, therefore, not surprising that many industries do not care to face the rigorous scrutiny and public glare consequent on asking for protection; they prefer to rely on the more effective, though less permanent, import control procedures.

Dovetailing of the procedures and safeguards visualized in the Tariff Commission's mode of inquiry with the need for a long-term rigorous import control, policy will make an important advance on the present administrative and somewhat *ad hoc* decisions. It may be necessary to set up a Fiscal Commission to look into this question and recommend the methods for bringing about this combination in the best possible manner.

**Export Promotion:** The only long-term solution to our present trade difficulties consistent with India's membership of the international economic organizations is to secure an appreciable increase in the present level of export as import reduction to the present level of import capacity seems unlikely. Since capital aid has reached almost the maximum, no further increase in its quantum is likely. The Third Plan estimated a foreign aid of Rs. 2,200 crores, against a public sector outlay of Rs. 7,500 crores.

The actual utilization amounted to Rs. 2,423 crores in a total public sector outlay of Rs. 8,577 crores. During the three annual Plans foreign aid utilized amounted to Rs. 2,426 crores.

The Fourth Plan assumes foreign aid only marginally above the level of the Third Plan and it is expected that by 1980-81 it will be possible to eliminate dependence on foreign aid. The balance on invisible account (excluding official donations), which showed a surplus during the First and Second Plans mainly on account of interest on sterling balances, and was expected to show a deficit by the middle of the Third Five Year Plan because of heavy interest payments on past loans, became deficit even by the first year of the Third Plan. Though there was some improvement on this account during the last three years of the Third Plan, the deficit on invisible account became substantial by 1968-69 at about Rs. 32 crores. Repayment of earlier short period loans is also becoming a significant liability.

Whatever way one may look at it, the need for a rapid increase in exports is imperative. Hitherto, the increase in our export has been halting. The great increase in our national income and industrial production as well as the rapid growth of world trade have had little effect on our export effort. As a proportion of world trade, (excluding the Communist bloc) Indian exports have diminished in importance from 2.6 per cent in 1948 to 1.3 per cent in 1958; it accounted for less than 1 per cent of world trade in 1968. The exports amounted to 5.2 per cent of the national income in 1948-49 and went upto 7.3 per cent in 1951-1952; its share in national income declined to 4.4 per cent in 1962-63, and further to little over 2 per cent by 1968-69.

The main reason for this has been two-fold. World trade in India's traditional export products has been increasing at a much slower pace than total world trade; and in new industrial products, where demand is likely to grow fast, India has yet some way to go to become competitive. The new industries cannot compete with foreign products even at home; they need heavy protection. It is much more difficult for them at this stage of development to make major dent in the foreign markets. Exports, therefore, have to be pushed up. In the earlier post-war years partly because of the accumulated sterling balances, India did not realize the need for consistent, vigorous and bold export promotion policy.

As an instance of thinking in this regard, one can take the Report of the sub-committee on Trade of the National Planning Committee which stated: "Even regarding imports of machinery which are likely to be heavy in the future, we are not convinced that it will cause a great strain on our balance of payments". It, therefore, thought that "the programme of expanding our export markets is, therefore, by no means as vital for this country as for the U.K. or U.S.A.". In fact, it was even prepared to stop unremunerative exports. Shortages at home, inflation, and lack of cost and quality consciousness were allowed to have their full impact on exports; in fact, export quotas were used to reduce exports. In the last decade or more, however, there have been major changes in export policies and a significant and conscious export drive has been put into operation. The foreign exchange crisis which became almost acute by the beginning of the Third Plan lent further urgency to examine the nature of export incentives and export subsidies. These efforts at export promotion though useful did not produce all the results expected of them and the aggravating foreign exchange crisis necessitated the devaluation of the rupee in June 1966.

The export promotion measures may be broadly divided into two parts; (a) those aimed at removing the disabilities which Indian export products have to suffer compared with other competitors because of import controls and other Government policies; and (b) measures which really aim at giving specially favourable conditions for export. It may also be useful to distinguish between general export promotion measures, whose advantages are accessible to all exporters, irrespective of their export product and concessions whose effects depend on the nature of the export product. The Government of India's import control measures have imposed a grave handicap on Indian export industries, because unlike their competitors they cannot get their import requirements easily. The domestic substitutes for these may be inferior, costly or not available at all. To put the exporters in a fair position, it is necessary that they should be given the import components of their exports at world prices. Since it is often difficult to take measures which will only improve the facilities for production earmarked for exports without also changing the rest, an import licence for a value greater than the import component of the exports may be justified. Both because of revenue and protective measures, import duties on certain capital and intermediate goods have been heavy; excise duties have also been levied on intermediate goods like steel and cement. Arrangements for rebate or drawback of such duties as enter into the costs of exports have to be made as a part of a policy to put exports on an even keel. Exporters have to face various risks of change in foreign situation, such as exchange rate changes, very different from those which may have a bearing on domestic trade.

Special credit facilities for exports are also necessary. This situation has been provided for by the setting up of Export Risk Insurance Corporation, now transformed into the Export Credit and Guarantee Corporation. Import bills have been brought within the purview of the bill market scheme in order to increase credit facilities for exports. For certain engineering and capital goods, the Refinance Corporation of India Ltd., provides credit facilities for five years through banks.

While these did not attract much attention from abroad as being usual facilities offered to exporters almost all over the world, export incentives offered prior to devaluation in June 1966 through import entitlements did create some controversy. The scheme of import entitlements (which also included supply of controlled scarce materials like steel at concessional prices) was very complicated and varied from commodity to commodity. The entitlements were in each case broken up into special sub-groups and there was a ceiling to each, so that it became difficult to translate them into financial terms. Also the import entitlements in some cases were available not only for use of the exporting firms, but could also be sold to other approved exporter. More surprisingly, they occasionally included commodities which had little to do with the production of the specific export commodity and, therefore, became financial inducements only. In general, these entitlements were confined to exports in new markets or exports of non-traditional products, and amounted to twice the import content of exports or 75 per cent of the export value, whichever was lower. The import entitlement was also, in some cases, higher at 100 per cent of the export value. By and large, the entitlements were broadly so devised as to enable the exporters to cover the losses if any on their export sales, and were regarded as a type of differential export subsidies meant to make exports competitive similar to protective duties on the import side. They were at least taken in that light by the mercantile community. Viewed, thus, they were rather cumbersome.

It had been argued that a change in the exchange rate will be preferable to the scheme of import controls and differential export incentives and other export promotion measures that we had in this country. It was also stated that the adoption of this measure will enable us to get rid of various evils of bribery, corruption, favouritism and inefficiency, and will provide a more powerful urge to the adoption of the right import substitution and export promotion activities.

Import controls fulfil a three-fold purpose: (a) protecting industries against the full blast of ruthless outside competition; (b) restricting imports of non-essential goods whose production is not permitted to be expanded domestically as a measure of consumption control; and (c) conserving foreign exchange resources are distributed among various uses according to the planning priorities so as to lead to rapid economic

development. The third purpose is so comprehensive that it automatically covers the first two. Each of these objectives demands that the Government or some public body should discriminate among the import commodities according to some priorities, and no uniform rise in price which devaluation implies would be of help. However, after the Chinese aggression the domestic costs of production and also prices went up sharply. The process of rising prices was further aggravated by severe drought conditions that prevailed in this country during 1965-66. As a result the rupee became too much over-valued in the international market and called for a more drastic corrective step than the existing discriminatory import controls and export subsidies. Keeping this in view, the rupee was devalued in June 1966 by 37.5 per cent in terms of gold and by as much as 57.5 per cent in terms of foreign currencies. Devaluation was only expected to provide a general corrective to the imbalance in the domestic and the foreign value of the rupee. This was not, *per se*, expected to bring about specific changes in the import and export levels of specific commodities, it was again considered necessary to take recourse to enhanced tariff barriers including export duties, coupled with, wherever necessary, export duties.

**Bilateral Trading:** Other significant features of India's international trade during the last two decades have been trading agreements, purchase and sale agreements on rupee payments and State trading. It has been the experience of countries faced with severe foreign exchange shortages that a system of mutual discrimination among themselves helps their foreign trade and aids economic growth and that insistence on complete multilateralism hinders their progress. Limited multilateralism or bilateral expansionism proves a beneficial step under these conditions. Later on when economic circumstances change, the countries concerned can once more pass on to full multilateralism with all its advantages. After independence, India has more or less always found herself hindered by exchange shortages, but somehow, apart from discriminatory measures to relieve the dollar shortage, it stuck to non-discrimination with few exceptions till the mid-Second Plan. It entered into several commercial agreements with other countries, and some of them even mentioned in detail the commodities which they were interested in purchasing from and selling to each other. They were, however, only goodwill agreements. While the trading list expressed a general willingness to issue the licence it did not imply any sale or purchase commitments, nor was any mechanism like the payments agreement set up which would induce mutual trade. Since 1957, however, the Government of India has entered into a number of trade agreements. By March 1964, nearly 24 such agreements were in force of which 13 were on rupee payment basis with East European countries. The list

has since been enlarged and by now it covers about 50 countries. Also about 50 per cent of India's export trade and 35 per cent of import trade is with these countries under bilateral arrangements. Rupee payment arrangements, however, cover about one-fifth of India's exports and about one-eighth of her imports.

For many reasons, it has been found easier to work such arrangements with the U.S.S.R. and Eastern European countries. The latter have planned economies, and prefer to be sure about their external purchases and sales. They do not have much faith in the world market mechanism and do not like to pay in convertible foreign exchange. On our part, because of our exchange scarcity and non-viability of some of our exports, we preferred sure markets and linking of sales to purchase. The communist group of countries especially the U.S.S.R. was in a position to supply developmental goods which we needed. Our trade with this group of countries expanded rapidly. This was partly a consequence of the rapid rate of economic growth in these countries, which because of some trade liberalization, ensued in greater increase in trade, but the institutional arrangements greatly facilitated trade with them.

Table XII brings out the increase in our trade with East European countries. The import trade with these countries increased many-fold from Rs. 2.2 crores in 1952-53 to Rs. 301 crores in 1968-69 and export trade from 2.16 crores to 266.5 crores. The U.S.S.R. played a predominant role in this group. Its imports from India increased from

| 1963-64     | 10,902         | 12,377         | — 1,475        |
| 1964-65     | 14,388         | 14,499         | — 111          |
| 1965-66     | 15,658         | 15,668         | — 10           |
| 1966-67     | 22,567         | 23,014         | — 477          |
| 1967-68     | 22,594         | 22,220         | + 373          |
| 1968-69     | 26,651         | 30,104         | — 3,543        |

0.85 crores in 1952-53 to Rs. 52 crores in 1963-64 and further to Rs. 148.3 crores in 1968-69; the exports rose from only 0.24 crores to Rs. 68 crores in 1963-64 and further to Rs. 185.5 crores in 1968-69.

An analysis of the trade balance with the East European countries shows that while the trade balance has been somewhat fluctuating, it has at no time been widely adverse in relation to the level of trade after 1957-58. In 1955-56, imports from these countries were twice the exports. After 1957-58, they were in rough equality. They were a little lower in the first three years and higher for the next three. Since on capital account, India has a favourable balance with this group, the balance on payments account would make a much better showing.

The pattern of exports and imports with the communist countries is very similar to that of India's general trade with developed countries. About three-fourths of the total import bill was spent on iron and steel, capital equipment and non-ferrous metals. Chemicals, railway stores, vehicles and air crafts were the other important imports. Tea, jute manufactures, hides and skins and vegetable oils accounted for half the exports. Ores, cashew nuts, spices, footwear and oilcakes have recently acquired some importance. India has thus succeeded through this arrangement in getting highly needed developmental goods, but diversification of exports has not been significantly helped.

The behaviour of Indian foreign trade with other bilateral trade countries is almost a reminder of the fact that bilateral trade can only help under certain conditions. Trade with this group has not been at all responsive to the introduction of this device. Leaving out China (Mainland), trade with which hardly lends itself to any economic analysis, even before the emergency, Pakistan and Burma were the two most important trading partners in this category. In both these cases, foreign trade greatly shrank, as a result of the political and economic relations with Pakistan and the unsettled political and economic conditions of Burma. With Pakistan, external trade almost came to a standstill after the Pakistani aggression of 1965. U.A.R. is the only country exports to which have shown substantial expansion (Table XIII).

**State Trading:** Another big institutional change that has been attempted is the setting up of the State Trading Corporation (S.T.C.) in 1956. Negotiation and fulfilment of long-term export agreements affecting a substantial part of domestic production can only be completed and executed by large producers' or traders' associations or organizations. If it is thought inadvisable to promote them or entrust them with this work, the only practicable alternative is the establishment of a trading corporation by the State which can handle imports or exports in bulk. New export lines or additional exports of traditional products on a substantial scale demand the creation of new production and transport

facilities, new credit arrangements, vigorous foreign propaganda and publicity, establishment of new market channels, study of foreign tastes and willingness and capacity to bear short-term losses. It is only a body with large resources acting in close collaboration with the Government that can fulfil these requirements. For promotional activities in export products, produced on a small scale also, the State Trading Corporation is also well-suited; it can take a long-term view, extend the necessary facilities to producers, and help in quality and schedule being properly observed. The S.T.C. can thus be effectively used either to mop up the uncertain fluctuating gap between the demand and supply price of scarce imports, or to arrange for their controlled distribution. By its purchase and sale policies, it can also play an important role in stabilizing prices of export and import products. Its commanding position enables it to give a right and vigorous lead to private traders, and act as a catalytic agent.

There is, however, an important limitation to the activities of the S.T.C. The world markets are volatile, and need much closer study and quicker adjustment than internal trade or production. A very keen eye on the world market changes has to be developed in order to succeed. The S.T.C. with its bureaucratic methods may find it difficult to operate particularly in areas where standardization has not proceeded far or where bulk handling is not possible. On the other hand, in staples and standardized goods the S.T.C. can make a much better success, especially if it can evoke the co-operation and willing support of private trade. The S.T.C. has made good progress over the last few years. Apart from significantly increasing its turnover it has also strived for and succeeded in diversifying exports by finding out new export commodities and market. For example, it has introduced shoes, sports goods, tea, coffee, woollen goods, and razor blades to communist countries and marine salt to Japan and Sri Lanka.

In order to make its operations more effective, in October 1963 a separate corporation *viz.* The Mineral and Metal Trading Corporation was set up to handle trade in minerals and metals particularly ores.

The S.T.C. has also entered into barter and linking arrangements as special instruments of export promotion. The link arrangements are made with selected firms of standing having connections with the foreign country concerned to establish suitable markets for Indian goods. These have also proved a success.

Barter deals are resorted to for disposal of commodities with no ready market. The device can enable exports of commodities which no financial incentive can get across. It is not always necessary to sell these commodities at less than world prices. Sometimes the anxiety of the other party to dispose of some goods which we need can be used to obtain world prices for them. In entering into such transactions, due

care has to be taken to ensure that the goods so exported are additional exports which could not have been sold in the normal way; that the commodities imported in turn are really needed according to our priorities, and that the commodity terms secured are ascertainable and not unfair. Occasionally, loading of imports may also be necessary on tactical grounds, but it has to be done very selectively. If these safeguards are observed, the deals which the S.T.C. may conclude will add to our export promotion effort. Through such transactions, S.T.C. has often succeeded in selling manganese against steel, or sugar against fertilizers.

The S.T.C. has also helped private manufacturers in locating new markets and getting orders when their unaided efforts were of no avail. For instance, it helped the salt manufacturers in selling their products. Further, under the Export Aid to Small Industries Schemes the S.T.C. has succeeded in export promotion through proper assistance in securing the quality and schedule of articles offered for export by giving raw material and other facilities. The S.T.C., under direction from the Government of India, also operates buffer-stock schemes in jute, seed-lac and lemon-grass oil which have proved beneficial to the growers.

The S.T.C. has played a relatively more important role in imports than in exports. The goods handled vary widely from machinery to chemical goods, fertilizers and consumption good like cloves and betelnuts. Its profit margin on these items has varied from  $\frac{1}{2}$  to 10 per cent depending on the nature of the commodity, the possibility of sale at a profit and the price of the domestically produced competing goods. For about 75 per cent of its turnover the maximum margin is 10 per cent, but scarce items such as camphor are sold at a higher margin. The profits are used to finance export losses.

The S.T.C. must be judged not by the size of the trade that it handles or entirely by what happens in this sector. Policy decisions can immediately increase or decrease its turnover. It is also expected to help in the promotion of private foreign trade. Its results must, therefore, be judged by its contribution to India's export expansion or prevention of its export decline. However, since changes in India's export trade are the result of several complex factor, it becomes difficult to evaluate the S.T.C.'s role in this direction.

The S.T.C. has rendered distinct services in some spheres of export trade. The most important, probably, is the trade with the East European countries. The expansion of iron ore exports also owes considerably to its efforts and foresight. This area of trade has since been transferred to the M.M.T.C. which in turn has drawn up ambitious plans for iron ore and mineral exports. While the expanding demand for iron ore and the comparative advantage in mining that India has are the basic favourable factors, the long-term sale agreements and alternative

transport arrangements that the M.M.T.C. has made to fulfil its commitments, have enabled these factors to be efficiently exploited. Manganese ore is the reverse example, where the comparative advantageous situation has been working against India, and the M.M.T.C. through link and barter agreements, has tried to minimize its adverse impact.

S.T.C.'s efforts in other directions through the 'Export Aid to Small Industries' or the Handloom Export Organization are yet to make a sizeable impact. From the view-point of affecting the export trade as a whole, it is still not in a very fortunate position as directly and indirectly it as yet handles only a small proportion of the total export trade. However, after gaining some more experience, it should be able to expand its activities in a big way and produce a sizeable effect on the size and complexion of India's exports.

**General Agreement on Tariffs and Trade (G.A.T.T):** As a part of the network of laying down codes of conduct regulating international economic relations and facilities for multilateral trade, an International Trade Charter was drawn up and signed by fifty-four nations in 1948. The signature only signified agreement regarding what transpired. Ratification by Governments concerned was to follow, but the necessary majority could not be mustered, so that the Havana Charter with its elaborate provisions regarding proper trade policies could not come into force. Anticipating the delay that the preparation and acceptance of an elaborate international Trade Charter was likely to mean, the Preparatory Committee of the U.N. Conference on Trade and Employment held in 1946, decided that at its second session in Geneva in 1947, members of the Preparatory Committee should negotiate for a substantial mutual reduction of tariffs and other trade barriers as contemplated under Article 17 of the proposed charter. The concessions received or granted were extended to all the member nations almost automatically, but provisions had to be made to ensure that no member country continued to enjoy the advantage of the extension of such reductions without offering equivalent concessions. The principle of mutuality and reciprocity was insisted upon. It was thus hoped to secure the advantages of the unconditional "Most-Favoured Nation" (M.F.N.) clause without any of its conspicuous disadvantages by combining some elements of the conditional clause. Agreements to reduce duties or bind them could be defeated in practice with other supplementary trade policies. The General Agreement on Tariffs and Trade, therefore, also contained the principle of M.F.N. treatment and other general commercial provisions similar to those of the Havana Charter. At the Geneva, Annecy and other subsequent negotiations India took enthusiastic part and agreed to bind a number of general duties and reduce many revenue duties.

Since agreements become binding for a long period, and it is difficult

to get release from their enforcement afterwards without undergoing complicated procedures and the threat of arousing ill will, nations like India with their economies in transition have to be quite careful in making such commitments. It has to visualize its revenue and protective needs a few years ahead and see that the bindings will not conflict with these. Due to many fortunate circumstances, India has had no occasion of this type.

There are two other requirements of the G.A.T.T. which can come in some conflict with the course of action needed for Indian economic development—the G.A.T.T. use of quotas, and its prescriptions on trade preferences and discrimination. Like its financial counterpart, the International Monetary Fund (I.M.F.), the G.A.T.T. is averse to the use of quantitative controls, which do not work in conformity with the price mechanism. Quotas for protective purposes are allowed only under special circumstances, e.g., when it can be established that there is no other method of protecting the industry more consistent with the agreement. Strictly interpreted this makes resort to protective quotas exceptional, and in modern practice these happen to be the most effective way of sheltering domestic industry. India, having an adverse balance of payments, can resort to import quotas on balance of payment grounds. These have a protective effect and can be so administered as to optimize it. Quotas have to be administered in a non-discriminatory way, but bilateral arrangements are re-permitted to the extent allowed by the I.M.F. The causes of the adverse balance of payments and alternative remedies have to be discussed periodically with the G.A.T.T., but development policies cannot be called into question on the ground that they lead to an adverse balance. Hitherto, at the G.A.T.T. consultations on these topics, tables have been turned on the developed countries.

Preferential duties, however, are likely to offend. G.A.T.T. rules allow the continuance of factors such as Commonwealth preferences, only as a legacy from the past and insist on the margins of preference being not further widened. An extension of preferences is only allowed under very special circumstances and with the consent of the organization. These include cases where the area of international trade is small but where the benefits accruing to the country resorting to it substantially outweigh injuries to other parties.

A more vital question is, how far the G.A.T.T. provisions help under-developed countries like India in creating appropriate trade conditions for development. Since Article I, defining the objectives, specially mentions development, this is not an unfair test. Development is a many-sided process, and international economic relations can play only a limited role in bringing about this internal process of transformation and structural change. Even in this limited part, aid can play the lion's role and trade can only help afterwards. However, the complaint

hitherto, has been that trade is not pulling its weight at all, in aiding the process of economic development of the under-developed countries. In the fifties, while the exports of the developed countries have been growing at the very satisfactory rate of 6.2 per cent per annum; the exports of the under-developed countries have only increased at 3.6 per cent. In spite of severe controls in many under-developed countries, their imports have increased much faster. The result has been that foreign reserves have been fast drawn upon in spite of liberal foreign aid, and developmental programmes have been greatly hampered. As any considerable step-up of foreign aid is difficult and the problem of repayment has to be faced, a programme which will greatly increase exports from under-developed countries is called for. The situation has somewhat improved during the sixties when the rate of growth of exports from the under-developed countries increased to 6.1 per cent per annum, but even at this level the growth rate in exports is significantly behind that observed for the industrialized countries at 8.8 per cent per annum.

When both the Havana Charter and the G.A.T.T. instruments were drawn, the precise needs of development in the sphere of trade policies were not known. They, therefore, provided for such needs of developing countries on the trade front as were then visualized by the developed countries, and embodied in the then prevalent beliefs in the abolition or relaxation of trade restrictions with a few proved exceptions. The whole philosophy of the G.A.T.T. was based on the concept of equality and reciprocity. At negotiation rounds, the member countries were expected to offer one another equivalent tariff concessions. This presumed that countries were starting from a position of balance, and their tariff needs were more or less the same. The developing countries, experiencing a persistent pressure on their balance-of-payments and the need of protective tariffs were in no position to give any valuable tariff concessions. Nor in fact was this essential because their imports from developed countries were fast increasing, the only brake being their foreign receipts. If the developed countries could help augment them, they would automatically find an increase in their exports in this part of the world. At the insistence of India and other under-developed countries, the obstacles to increase in exports from the under-developed countries were investigated, and it was found that there were several trade practices such as tariffs, quotas, agricultural protectionism, internal taxes, and administrative regulations, in the developed countries which hindered the increase of exports from the developing countries. It was not possible to measure the restrictive effects of these measures but it was certain that their prevalence was acting as an inhibiting factor on the export promotion efforts of the developing countries. The latter had also a fear, based largely on the experience of the treatment of cotton

textile exports, that if they did succeed in pushing the exports of processed and manufactured products, the chances were that new restrictions might be levied on them. Textiles presented a special problem as they were a declining industry in developed countries. The G.A.T.T. had tried to deal with this problem through an International Cotton Textile Conference in 1961, where a one-year agreement for voluntary restriction of cotton textile exports was arrived at. In 1962, a five-year long-term textile agreement providing for liberalization was reached. For other commodities the developed countries had in 1963 agreed to a programme of action involving no new tariff or non-tariff restrictions, reducing duties on processed or semi-processed products by 50 per cent in three years, and eliminating inconsistent restrictions within a year. But nothing appreciable immediately followed.

## CHAPTER XI

# BANKING AND THE MONEY MARKET

### I Banking Before Independence

The origin of money lending in India has been traced back to the Vedic period c. 2000 B.C. to 1400 B.C. More specific references have been found in the literature pertaining to the 5th century A.D. The financial organization was rudimentary and the operations consisted primarily of lending, without its modern counterpart, acceptance of deposits. The use of *hundi* as an instrument of credit made its appearance in the 12th century A.D. and laid the foundation of what later came to be called indigenous banking. By the time the British traders came to India in the 17th century, money lending and indigenous banking had been fairly well established. They formed the core of the financial market of those times.

Money lending was most often combined with other activities like trading, zamindari, etc. The methods of business varied widely. Normally loans were given on trust; sometimes they were secured against promissory notes, mortgage of land, houses, ornaments or cattle. In rural areas, loans were usually repayable at harvest time. The rate of interest was exorbitant. The indigenous bankers adopted more sophisticated business practices and were located mainly in towns and cities. The business was largely handled by *Shroffs*, *Chettiars*, *Multanis*, *Marwaris*, etc.

Modern banking business was initiated by British Agency houses set up in Calcutta and Bombay. Cooke has mentioned that the first bank called Bank of Hindustan was established in 1770. Later researchers have, however, doubted the validity of this statement. The development of banks was extremely slow and was confined largely to ports and important cities. The banks mainly financed trade and Government.

A major breakthrough in banking came with the establishment of the Presidency Banks in Calcutta, Bombay and Madras. The Bank of Calcutta was set up in 1806 principally to give support to Treasury Bills which were subject to acute seasonal fluctuations. Government held one-fifth of the share capital of the bank which was empowered (in 1823) to issue notes also. Subsequently (in 1840 and 1843) the Bank of Bombay and the Bank of Madras were established with minority Government participation. The Bank of Bombay went into liquidation in 1868; its place was taken by a new bank in the same

year with the same name. In 1862, the banks were deprived of the power to issue notes and in 1876 Government withdrew all its interest in banking business. The three banks were amalgamated into a single bank called the Imperial Bank of India. At the time of amalgamation in 1921, the banks had 59 branches and Rs. 7.2 crores of paid-up capital and reserves. The Imperial Bank was nominated banker to Government and it undertook some of the functions of a Central Bank. Currency management, however, remained with Government.

The development of joint stock banks was accelerated after Act VII of 1860 which introduced the principle of limited liability. However, banking was not a specialized business and most banks combined other interests as well. As such, nearly a half of the joint stock banks which came into being in 1833-60, failed. The business climate was vitiated by the cotton crisis; and in the subsequent five years, only one bank, viz., the Allahabad Bank, was established. Not much headway was made in the last quarter of the 19th century. By 1900, there were only 20 commercial banks, including 8 exchange banks, with deposits of about Rs. 34 crores. The other savings institution which registered some progress was the Post-Office Saving Bank.

The pace of banking dramatically changed after 1906. In the next seven years, nine new large banks, with paid-up capital of over Rs. 5 lakhs each, were set up. These included the Bank of India, the Indian Bank, the Punjab and Sind Bank, the Central Bank of India, the Bank of Baroda and the Bank of Mysore. In 1912, the Indian Life Assurance Companies Act was passed. This introduced some rationale in insurance business but it was replaced by more comprehensive legislation in 1939.

Modern industry which had taken root in 1870 was beginning to assume definite shape after the Swadeshi movement. There were 5,189 joint stock companies in 1921-22 with a total paid-up capital of Rs. 231 crores. Jute, cotton, iron and steel, coal and tea were the major lines of activity. Industry was emerging as a potential client of the banking system. The growth of joint stock companies also necessitated a market for buying and selling shares. The first stock exchange was established in Bombay in 1887. This was followed by the setting up of stock exchanges in Ahmadabad, Calcutta and Madras.

The years 1913-24 were critical and about 161 banks with a paid-up capital of Rs. 6.75 crores went into liquidation. By 1925, there were 93 commercial banks, including 18 exchange banks, with deposits of about Rs. 212 crores. In the next five years, their number had increased to 107 and their deposits to Rs. 220 crores.

Banking business was limited in scope. Only 400 out of 2,500 towns, were served by joint stock banks and their branches. Indigenous banking and money lending still dominated the financial market. These survived even in places having banking facilities possibly because of their flexibility in business practices. To some extent, they also performed complementary functions which made them, in a limited way, a hand-maid to the banking system. Thus, the Report of the Indian Central Banking Inquiry Committee pointed out: "They performed the functions analogous to those of big brokers of the London Money Market". Available statistics indicate that there were about 100,000 money lenders and indigenous bankers in Bihar and Orissa and 20,000 in Bombay. In Bengal, the number of money lenders was 45,000 and in the Punjab 55,000.

Insurance was also making its way as a savings institution. The number of life insurance companies—Indian and foreign—went up from 72 in 1913 to 240 in 1930, with the business in force amounting to Rs. 88.66 crores.

The monetary and credit situation was not subject to unified control. As the Hilton Commission remarked in 1926: "The Government controls the currency; the credit situation is controlled as far as it is controlled at all, by the Imperial Bank. With divided control, there is likelihood of divided counsels and failure to co-ordinate . . . The only certain way to secure co-ordination is to concentrate controls in one hand. In other countries, the single controlling hand is that of a Central Bank". This recommendation was acted upon. In 1927, an attempt was made to create a Central bank called the Reserve Bank of India. The first attempt proved abortive. After considerable political debate, the Reserve Bank of India Act was passed in 1934. This was a major step in imparting a degree of cohesiveness to the monetary and credit situation, in imposing some financial discipline on scheduled banks and promoting better management of money and credit.

On the eve of the Second World War there were 679 commercial banks including 19 exchange banks. Their total deposits were Rs. 277 crores.

The war years gave a tremendous stimulus to the growth of banking. Excluding Burma, the deposits of commercial banks stepped up to Rs. 915 crores by 1944. By the time the country achieved independence in 1947, India had a fairly well developed and closely knit banking system with 648 banks having 4,819 branch offices. The deposits amounted to Rs. 1,164 crores, about 13 per cent of the national income. About 42 per cent of the deposits were invested in Government securities and 47 per cent used to give advances or

discount bills. Trade was the major client accounting for nearly a half of the total advances. Another one-third was taken up by industry.

The division of the monetary system into organized and unorganized sectors continued, although their shares had substantially altered. The organized sector comprising joint stock banks—scheduled and non-scheduled—with the Reserve Bank of India at the apex, had grown in size both absolutely and relatively. The unorganized sector was less important. It survived because first, banking was not widespread; secondly, there was some spill over of demand for funds; and thirdly, indigenous banking provided more personalized service. The co-operative sector had emerged as a source of finance in rural areas but hardly met even 3 per cent of the financial needs of agriculturists. Commercial banks had not entered the rural sector. For the bulk of their requirements the agriculturists depended on the traditional money lenders. The development of industry had given a spurt to trading in shares and organized stock exchanges had been put up in all industrial cities. There were 158 life insurance companies with Rs. 612 crores business in force. Thus the whole financial organization had, by the time the country became independent, developed sufficiently and provided the necessary infra-structure for the growth of the economy in the post-independence years.

## II. History of Banking Legislation

Banking companies until 1936 were governed like other companies by the Indian Companies Act 1913. This Act, no doubt, made a distinction between banking companies and other companies but only in minor respects. For example, Section 4 of the Indian Companies Act 1913, prohibited a partnership from carrying on banking business unless it was registered as a company. Banks were required to submit returns every six months and were liable to inspection by the local Government. With the growth of the banking system and the periodical crisis to which it was exposed, it was realized that banking business was on a different footing and had to be regulated by a separate law.

It was also felt that the credit system, as in most other countries, should be brought under the control and supervision of a Central bank. The issue was examined by J. M. Keynes and Sir Earnest Cable in 1913. A specific proposal for setting up a Central bank called the Reserve Bank of India, was made by the Hilton Young Commission in 1926. After a protracted controversy and debate, the Reserve Bank of India Act was passed in 1934. The bank was set up as a share-

holders' bank with the object of "securing monetary stability in British-India and generally to operate the currency and credit system of the country to its advantage". Government control was limited to the appointment of the Governor and two Deputy Governors after considering the recommendations of the Central Board.

The specific functions of the Reserve Bank of India (R.B.I.) included issue of notes, providing banking facilities to Government and other banks, and maintaining the exchange ratio. The bank was given the exclusive right to issue bank notes. It had two Departments, viz., the Issue Department and the Banking Department. Two-fifths of the assets of the Issue Department were to consist of gold coins, bullion and sterling securities. As banker to Government, the bank had to accept moneys or make payments on behalf of Government and to manage the Public Debt. Government in turn were obliged to deposit, free of interest, all their cash balances with the bank. An equally important role of the bank was to regulate the banking system in its capacity as banker's bank. Scheduled banks (and later State co-operative banks) were required to maintain with the Reserve Bank a cash balance equal to not less than 5 per cent of their demand liabilities and 2 per cent of their time liabilities in India. In return, the Reserve Bank was to provide accommodation to scheduled banks in the form of rediscounts and advances.

The relations of the Reserve Bank with the money market were to be mainly conducted through scheduled banks. The main instruments of control were the bank rate and open market operations. Since its inception, the Reserve Bank was also entrusted with three special obligations, viz.; to provide credit to agriculture, develop the bill market and to bring the unorganized sector within its ambit.

The Reserve Bank of India was a stabilizing and unifying force. But joint stock banks were not themselves subject to the type of regulation necessitated by the nature of business. The issue had been examined in 1929-31 by the Central Banking Inquiry Committee which found that the Indian Companies Act was inadequate and recommended separate banking legislation. In 1936, the Indian Companies Act was amended by the addition of a separate chapter containing provisions pertaining to banking companies. In terms of this amendment, a bank was defined as "a company which carries on its principal business the accepting of deposits of money on current account or otherwise subject to withdrawal by cheque, draft or order". This definition was soon found inadequate and had to be modified. Banks were prohibited from carrying on any other business, could not be managed by managing agents other than banking companies, and had to have a minimum capital of Rs. 50,000.

The 1936 Amendment to the Indian Companies Act was a stop-gap arrangement. A full-fledged banking law was on the anvil. The failure of the Travancore National and the Quilon Bank in 1938 hastened the pace of legislation and the Central Board of the Reserve Bank submitted proposals to Government in November 1939, in the form of a draft bill. Although consideration of the bill was postponed, some of its provisions were enacted in 1942 and 1944. After the Second World War, the bill was revised and finally enacted in the form of the Banking Companies Act in February 1949.

The Act defined the business to be carried on by banks, required banks to dispose of non-banking assets, prohibited employment of managing agents, specified minimum capital, debarred common directorships between banking companies, fixed cash reserves, restricted the nature of subsidiary companies, imposed limitations on loans to directors of firms or private companies in which directors were interested, empowered the Reserve Bank to control advances of banking companies in respect of purpose, margins or rate of interest, necessitated a system of licensing of banks, compelled banks to invest 20 per cent of their time and demand liabilities in liquid assets, made it obligatory on the part of the banks to submit information to the Reserve Bank, etc. The legislation was comprehensive and introduced considerable discipline in banking operations.

The principal object behind legislation since independence was to give a greater degree of protection to the public, exercise better control on the financial organization and management and ensure a socially desirable distribution of credit. The Rural Banking Inquiry Committee had drawn attention (in 1950) to the need for extending banking facilities to rural and semi-urban areas. On the recommendation of the All India Rural Credit Survey Committee, the Imperial Bank was nationalized in 1955 and renamed State Bank of India (S.B.I.) The State Bank was required to establish not less than 400 additional branches in 5 years. While it was to continue to undertake commercial banking functions, it was specifically desired to contribute to rural credit and provide financial assistance to small scale industries. Also, the Reserve Bank of India Act was modified to set up the National Agricultural Credit (Long-term Operations) Fund and the National Agricultural Credit (Stabilization) Fund. The object was to enable the Reserve Bank to strengthen the co-operative structure and provide larger funds for rural development. An equally important measure was the nationalization of life insurance companies and the setting up of the Life Insurance Corporation of India in 1956.

The Reserve Bank of India Act 1934 had imposed limitations on the asset pattern of its Issue Department. This 'relic of the past' was done away with by an amendment to the Act in 1956 and later in 1957. In terms of these amendments, the Issue Department was required to hold only a minimum amount of Rs. 200 crores of foreign exchange assets, Rs. 115 crores of which were to be in gold. Money supply thus became completely a matter of 'fiat'.

The Reserve Bank control on credit was further strengthened in 1956. The scheduled banks were required to keep with the Reserve Bank 5 per cent of their demand and 2 per cent of their time liabilities. These ratios were made variable between 5 per cent and 20 per cent in respect of demand and 2 per cent and 8 per cent in respect of time deposits. This measure added another dimension to the credit policy of the Reserve Bank. The Banking Companies Act of 1949 was also amended to give the Reserve Bank additional supervisory powers. Sections 12 and 16 were amended to prevent misuse of voting rights through concentration of shareholding and Sections 35 and 36 to enable the Reserve Bank to issue directives to banks in matters of policy, approve the appointment of managing directors managers and chief executive officers, and appoint observers on the Board of Directors. Further amendment in 1959 necessitated Reserve Bank approval to appointment of Directors also.

The Reserve Bank of India was also emerging as a promotional and developmental agency. It had contributed to the share capital of the Industrial Finance Corporation of India (I.F.C.). It was providing finance to agriculture. In 1957, the Reserve Bank of India Act was amended to enable the bank to contribute to the share capital of any financial institution. This was done in anticipation of the bank's role in the Refinance Corporation for Industry which was set up in 1958. The State Bank of India Act was amended to enable it to give medium-term credit. In 1960, the Reserve Bank was enabled to give credit facilities to State Finance Corporations. The Reserve Bank also subscribed to the capital of the Industrial Development Bank of India (I.D.B.I.) which was established in 1964. Similarly, the State Bank of India (Subsidiary Banks) Act 1959 permitted the State Bank to constitute 8 subsidiary banks.\*

The failure of the Lakshmi Bank and the Palai Central Bank in 1960 revealed many weaknesses of small and medium banks and pressed the need for statutory powers to cope with the problem. Accordingly, the Reserve Bank was empowered compulsorily to amal-

---

\*The Bank of Bikaner; The Bank of Indore, The Bank of Jaipur; The Bank of Mysore; The Bank of Patiala; The Bank of Travancore, The State Bank of Hyderabad and The State Bank of Saurashtra.

gamate weak banks with the strong, with the approval of the Government. The Reserve Bank was also allowed to declare a period of moratorium to facilitate such mergers and amalgamations. At the same time, to secure the interest of the public, particularly the small depositors, a Deposit Insurance Scheme was instituted. Additional measures were taken in 1962. The minimum capital of any new banking company was raised to Rs. 5 lakhs. The legal provisions in respect of liquidity of banks were altered in terms of which the minimum ratio of liquid assets to total deposits was raised from 20 to 28 per cent, comprising 3 per cent statutory reserves and 25 per cent other liquid reserves. Consequently, the Reserve Bank of India Act was also amended to require scheduled banks to maintain with the Reserve Bank an average daily balance of 3 per cent of total deposits as against 5 per cent of demand and 2 per cent of time deposits. The Reserve Bank was also empowered to vary the cash ratio from 3 per cent to 15 per cent. Thus, maximum liquidity ratio that could be statutorily imposed varied from 28 per cent to 40 per cent. The focus in credit policy gradually shifted from control of cash reserves to control of liquidity.

Supervision and control by the Reserve Bank were further strengthened in 1963 through the Banking Law (Miscellaneous Provisions) Act. The maximum voting rights of individual shareholders of banking companies were reduced from 5 per cent to 1 per cent of the total, the maximum term of office of persons managing the affairs of the bank was limited to 5 years, unsecured loans to any company in which the Chairman was interested were prohibited, the Reserve Bank was enabled to issue directions to banks regarding the maximum amount of advances or guarantees that could be given on behalf of any borrower, and was empowered to remove from office any person associated with the working of a bank, if considered desirable.

Thus, by 1963, the Reserve Bank had assumed substantial control over the working, operations and management of banking companies. But control on the credit system as such was only partial. A number of non-banking companies were also carrying on quasi-banking business. The Banking Law (Application to Co-operative Societies) Act, 1965 brought State co-operative banks within the ambit of the Reserve Bank's statutory control. The Reserve Bank also issued in 1965, and later in 1966, two directives under the Banking Laws (Miscellaneous Provisions) Act 1963 to non-banking financial companies and non-banking non-financial companies accepting deposits from the public. The directives prohibited companies from accepting deposits payable on demand and limited the period

*of deposits to not less than 12 months in the case of non-financial companies and to 6 months in the case of hire-purchase companies. The latter were required to hold a certain percentage of liquid assets. The new directive issued in October 1966, restricted the amount of deposits accepted by non-banking non-financial companies, other than housing finance and hire-purchase finance companies, to 25 per cent of paid up capital and free reserves. The definition of deposits was widened in 1971 to include unsecured loans also.*

The banking system had progressed fairly rapidly in the first two decades after independence. But there were some lacunae, mainly historical in nature, which failed to make the banking system conform to current social needs. There was considerable public debate which drew attention to the skewed pattern of distribution of bank credit in favour of industry, and that too, large houses. On the other hand, priority sectors like agriculture, small scale industries, exports, etc., were neglected. To overcome these deficiencies, Government adopted a scheme of social control over banks. This led to the setting up of a high level body called the National Credit Council in December 1967 and the enactment of the Banking Laws (Amendment) Act 1968. The short-lived Council was expected periodically to assess the demand for bank credit from various sectors, determine priorities for grant of loans and advances and co-ordinate lending and investment policies. The 1968 Amending Act provided for re-constitution of the Boards of Directors of banks so that more than a half of the members represented specialized fields like accountancy, agriculture, rural economy, small scale industries, co-operation, banking, economics, finance and law. At least two of the Directors were to represent agriculture, rural economy, co-operation and small scale industries. These directors were not to have substantial interest in any large or medium industrial or trading concern. A professional banker was required to be full-time Chairman and his appointment was subject to Reserve Bank's approval. Loans to directors were prohibited. Appointment of auditors needed the Reserve Bank's concurrence. The Reserve Bank was empowered to issue directions not only in the interest of depositors or proper management but also banking policy. Government was also enabled to acquire the business of any bank if it failed to comply with any directions.

The Banking Laws (Amendment) Act 1968 came into force from February 1, 1969 although banks with deposits of over Rs. 10 crores were persuaded to comply with the provisions of the bill even earlier. Simultaneously, Government set up a Banking Commission to examine the whole problem of banking organization.\*

---

\*The Commission submitted its Report in 1972.

The scheme of social control was on trial hardly for six months when Government announced the nationalization of 14 major Indian banks with effect from July 19, 1968.\* The objectives of nationalization as stated in the preamble to the Banking Companies (Acquisition and Transfer of Undertaking) Act 1970 were "to control the heights of the economy and to meet progressively and serve the needs of development of the economy in conformity with national policy and objectives."

Banking legislation through the years unfolds a story of increasing Government control on banks ending ultimately in substantial ownership. The initial measures were aimed mainly at protecting the interest of the depositors. This was followed by measures specifically designed to control the efficacy of the credit system; the final act of nationalization accepts banking as essential public institution which can be best operated through public ownership.

### III. The Reserve Bank of India

The Reserve Bank is the centre-piece of the money market. It issues notes, buys and sells Government securities, regulates the volume, direction and cost of credit, manages foreign exchange and supports institutions financing agriculture and industry. Within the immediate periphery of the Reserve Bank are the scheduled banks and State co-operative banks. Non-scheduled banks, which are a dying species, and the non-banking financial and non-banking non-financial companies accepting deposits from the public also fall within the ambit of the Reserve Bank's control although its extent and rigour is considerably less. The operations of the money lenders and indigenous bankers which are now relatively small are, however, largely outside the pale of the Reserve Bank policy.

The Reserve Bank has the monopoly of note issue. Small coins and one rupee notes which account for less than 9 per cent of the total currency in circulation, are, however, issued by Government. But the Reserve Bank undertakes their distribution as Government agent. Money supply in India is exposed to seasonal fluctuations, rising in the busy season, *i.e.* November-April and falling in the slack season *i.e.* May-October. At the end of April 1972, currency put into circulation by the Reserve Bank was Rs. 4,705 crores.

---

\* These banks which had deposits of over Rs. 50 crores each include: The Central Bank of India Limited, The Bank of India Limited, The Punjab National Bank Limited, The Bank of Baroda Limited, The United Commercial Bank Limited, The Canara Bank Limited, The United Bank of India Limited, The Dena Bank Limited, The Syndicate Bank Limited, The Union Bank of India Limited, The Allahabad Bank Limited, The Indian Bank Limited, The Bank of Maharashtra Limited, and The Indian Overseas Bank Limited.

The assets and liabilities of the Issue Department at the end of April 1972 were as follows:

**TABLE I**  
**RESERVE BANK OF INDIA**  
**Issue Department**  
**(End April 1972)**

| <i>Liabilities</i>           | <i>Rs. crores</i> | <i>Assets</i>                        | <i>Rs. crores</i> |
|------------------------------|-------------------|--------------------------------------|-------------------|
| Notes in circulation         | 4,749             | Gold coin and bullion                | 183               |
| Notes held in Banking Deptt. | 54                | Foreign securities                   | 222               |
|                              |                   | Rupce coin                           | 34                |
|                              |                   | Government of India rupee securities | 4,364             |
|                              | <u>4,803</u>      |                                      | <u>4,803</u>      |

The Reserve Bank has offices of the Issue Department at Bangalore, Bombay, Calcutta, Hyderabad, Kanpur, Madras, Nagpur, New Delhi, Patna and Gauhati. Besides, the bank maintains currency chests with branches of the State Bank and its subsidiaries and with Government Treasuries. At the end of September 1969, these numbered 1,968.

Being banker to Government, the Reserve Bank receives and makes payment on behalf of Government, holds the cash balances of Government, manages the public debt and undertakes remittances. The Central Government usually floats securities of long maturity (over 15 years) and short maturity (less than 5 years), while the State Governments float medium-term securities (about 12 years). Before the loans are floated, which is normally in May-July, the Reserve Bank grooms the market to enable it to take up the largest amount of loans. Treasury bills are sold on tap throughout the years. The Reserve Bank holds about 37.5 per cent of the Central Government securities and 0.3 per cent of State Government securities (1969). This part of the loans of Government really amounts to deficit financing. The bank also gives ways and means advances to Government.

The monetary policy of the Reserve Bank has been described as one of 'controlled expansion' of credit. The object is to restrain prices while ensuring, at the same time, that legitimate credit requirements for production are not adversely affected. The instruments of control are the bank rate, variable reserve ratios, open market operations, selective credit control and moral suasion.

The bank rate is the rate at which scheduled banks are able to get refinance from the Reserve Bank. Currently the rate is 6 per cent. The Reserve Bank has also introduced a system of differential

interest rates which penalizes excess borrowing by scheduled banks. The impact of the bank rate changes on interest structure (interest on Government securities, debentures, preference shares or equities), has, almost on all occasions, been negligible.

The technique of variable reserve ratios was used in 1960 in the sharp rise in prices but had, according to the Reserve Bank itself, 'limited success'. Open market operations can make significant difference to the money market by:

- (i) altering the ratio of securities to money in the pattern of financial assets, and
- (ii) altering the maturity composition of securities.

The first factor is circumscribed by the fact that the Reserve Bank as an agent of Government, is primarily interested in selling securities and as such is not left with much freedom to buy. The second factor has helped Government to keep only a very thin margin between long rates and short rates of interest. Since 1951-52, the Reserve Bank undertook net open market purchases in six years and net open market sales in 14 years. On an average, there were net open sales to the extent of Rs. 23 crores per year.

Selective credit controls stipulate a margin, impose a ceiling or regulate the rate of interest in respect of advances against the security of any commodity or shares. These controls are imposed when the price of any commodity shows an unduly sharp rise. Selective credit controls have been imposed on a variety of commodities like foodgrains, oil-seeds, cotton and *kapas*, etc. The impact of selective credit control is limited to the extent that borrowers are able to get credit from the unorganized sector. Selective credit controls have also been imposed on advances against the security of shares with a view to checking speculation and cornering.

The Reserve Bank manages the Foreign Exchange Control. The object of the control is to bring a balance between supply of and demand for foreign exchange. The control has been in force since the outbreak of World War II. The control was put on a permanent basis with the enactment of the Foreign Exchange Regulation Act 1949. The Reserve Bank does not deal in foreign exchange directly but through authorized dealers. In addition, there are also licensed dealers who undertake limited business of buying and selling foreign currency. The Reserve Bank exercises co-ordination and supervision and also collects information for compiling the balance of payments.

The financial aspects of banking operations are reflected in the liabilities and assets of the Banking Department. At the end of April, 1972 these were as follows:

**TABLE II**  
**Banking Department**  
**(End April 1972)**

| <i>Liabilities</i>                                           | <i>Rs. crores</i> | <i>Assets</i>                 | <i>Rs. crores</i> |
|--------------------------------------------------------------|-------------------|-------------------------------|-------------------|
| Capital and Reserves                                         | 155               | Notes and Coins               | 54                |
| National Agricultural Credit<br>(Long-term Operations) Fund, |                   | Bills Receivable              | 11                |
| National Agricultural Credit<br>(Stabilization) Fund, and    |                   | Treasury Bills                | 52                |
| National Industrial Credit<br>(Long-term Operations)<br>Fund | 364               | Balances held abroad          | 200               |
| Deposits:                                                    |                   | Investments                   | 86                |
| (i) Government                                               | 218               | Loans and Advances            |                   |
| (ii) Banks                                                   | 266               | Government (State)            | 762               |
| (iii) Others                                                 | 107               | Scheduled Commercial<br>Banks | 23                |
| (iv) Other liabilities                                       | 491               | State Co-operative Banks      | 273               |
|                                                              |                   | Others                        | 90                |
|                                                              |                   | Other assets                  | 50                |

The advances of the Reserve Bank to agriculture and other rural activities through co-operative banks have substantially expanded. Outstanding short-term credit in the 20 years, 1950-51 through 1970-71, went up from Rs. 3.4 crores to Rs. 269 crores, loans under the National Agricultural Credit (Long-term Operation) Fund to State co-operative banks, State Governments and land mortgage banks from Rs. 28.6 crores in 1960-61 to Rs. 71.4 crores in 1970-71 and outstanding debentures of land mortgage banks from Rs. 0.2 crores in 1950-51 to Rs. 31.9 crores in 1970-71. The Reserve Bank has thus contributed in a significant measure to agricultural finance. But the needs are phenomenal and, consequently, additional demands have been made on the State Bank and other commercial banks.

As a developmental and promotional agency, the Reserve Bank has contributed to the share capital and bonds of the Industrial Finance Corporation of India, State Finance Corporation and the Industrial Development Bank of India.\* These investments amounted to Rs. 64.6 crores at the end of March 1971. Apart from these, the Reserve Bank extends medium-term and short-term finance to I.F.C.I. and State Finance Corporations. The outstanding loans on this account were Rs. 4.1 crores (March 1971).

The Reserve Bank thus regulates money supply, controls and directs credit of the banking system, influences the structure of interest rates and provides finance on its own for agricultural and industrial development. The powers are wide and, excepting the money lenders and indigenous bankers, the whole credit system is under its control and influence.

\* With effect from August 1, 1964 the shares of the I.F.C.I. held by R.B.I. stand transferred to I.D.B.I.

## IV. The State Bank of India

The State Bank Group includes the State Bank of India and its subsidiaries. The bank has a Central Board of Directors and 7 local Boards at Calcutta, Bombay, Madras, New Delhi, Kanpur, Ahmadabad and Hyderabad.

The State Bank Group has close nexus with the Reserve Bank. The State Bank and its subsidiaries are agents for the Reserve Bank in places where R.B.I. does not have branches. With the nationalization of 14 major banks, the exclusive connection between Government and commercial banking through the State Bank has been superseded although these banks have not yet been authorized to transact Government business. The State Bank provides certain facilities to other scheduled banks which has earned it the title of 'lender of immediate resort'.

The State Bank Group had 3,781 branches, about 29 per cent of the total branches of commercial banks at the end of 1971. Most of these branches were in semi-urban and rural areas. The distribution by population was as follows:

TABLE III

|                                                            | <i>No. of<br/>branches</i> | <i>Per cent<br/>to total</i> |
|------------------------------------------------------------|----------------------------|------------------------------|
| Urban areas<br>(Population more than 1 lakh)               | 725                        | 19                           |
| Semi-urban areas<br>(Population between 10,000 and 1 lakh) | 1,541                      | 41                           |
| Rural areas<br>(Population below 10,000)                   | 1,515                      | 40                           |

The deposits of the State Bank at the end of 1971 were Rs. 1,502 crores and of its subsidiaries Rs. 406 crores. The total deposits of the State Bank Group were about 28 per cent of the deposits of all scheduled commercial banks. Advances amounted to Rs. 1,431 crores and investment in Government securities to Rs. 504 crores.

The assets and liabilities of the State Bank Group at the end of December 1971 were as shown in Table IV.

The commercial nature of the State Bank is undoubtedly paramount. Of the total advances of Rs. 1,432 crores, loans to priority sectors were only of the order of Rs. 481.6 crores or 34 per cent. In 1968, this proportion was 18 per cent. The State Bank Group has, no doubt, more rapidly complied with social control on banking.

The major beneficiaries in the priority sector were small scale industries, exports and agriculture in that order. The State Bank has

TABLE IV  
The State Bank Group

(Rs. crores)

| <i>Liabilities</i> |       | <i>Assets</i>                |       |
|--------------------|-------|------------------------------|-------|
| Capital funds      | 28    | Cash and balances with banks | 190   |
| Deposits           | 2,201 | Investments                  | 681   |
| Borrowings         | 98    | Advances                     | 1,457 |
| Bills              | 105   | Bills                        | 105   |
| Other liabilities  | 99    | Premises and other assets    | 98    |

instituted a number of schemes to provide credit to small scale industries. It was responsible for 37.3 per cent of the total credit provided by all scheduled commercial banks to small scale industries. Similarly, the State Bank Group provided Rs. 122 crores for financing exports and its share in total export credit was 30.8 per cent at the end of September 1971. The State Bank Group has also made considerable headway in the field of agricultural finance. It was responsible for 35.4 per cent of credit given by scheduled commercial banks to agriculture.

#### V. Scheduled Commercial Banks

At the end of March 1971, there were 73 scheduled and 12 non-scheduled commercial banks. By June 1971, the number of non-scheduled banks had fallen to 7. Non-scheduled banks are either being merged with scheduled banks or are increasing their capital to pass into the scheduled category. Of the scheduled banks, apart from the State Bank, 14 major banks each with deposits of over Rs. 50 crores were nationalized in July 1969. Nationalized banks account for 82 per cent of the total branches and almost an equal percentage of deposits of all commercial banks. The banking system is thus substantially owned and wholly controlled by Government through the Reserve Bank.

The development of banking has not been even as between States. In Gujarat, Kerala, Karnataka, Punjab, Tamil Nadu and Maharashtra, the banking habit has been more widespread than in Assam, Bihar or Orissa. At the end of March 1972, population per branch office in Assam was 1.01 lakhs and in Bihar 1.07 lakhs, compared to the national average of 41,000. In the opening of new bank branches, considerable attention has been given to regional balance and, consequently, the disparities between States have been somewhat reduced. Similarly, with the inception of the State Bank,

and more particularly after the nationalization of 14 major banks in 1969, particular effort has been made to locate banks' branches in rural areas. As a result, the percentage of branches in rural areas rose from 22.4 per cent in 1969 to 35.6 per cent in 1971.

Branch expansion is pursued systematically under the Lead Bank Scheme introduced in December 1969. Under this scheme, banking development is governed by what has been called 'area approach'. The districts are allocated among different banks and each bank is expected to "survey the potential for banking development in the allocated districts to identify institutional and credit gaps and to take the initiative in endeavouring to fill them and thus intensively involve itself in the process of economic advancement of the district concerned". By March 1972, there were 13,309 bank branches compared to 8,284 in July 1969. This phenomenal branch expansion has brought down the average population served per bank office from 65,000 to 41,000. The distribution of branches among various categories of banks was as follows.

TABLE V

|                         | <i>Per cent to total branches<br/>of commercial banks</i> |
|-------------------------|-----------------------------------------------------------|
| S.B.I. and subsidiaries | 29                                                        |
| Nationalized banks      | 53                                                        |
| Other scheduled banks   | 16                                                        |
| Foreign banks           | 1                                                         |
| Non-scheduled banks     | 1                                                         |
| Total:                  | 100                                                       |

The total deposits of the scheduled commercial banks were Rs. 7,524 crores at the end of June 1972, about a fifth of the national income. In spite of the commendable progress made by banks in the 1960s, and more particularly in the past 3 years, there is considerable scope for further development. The comparative ratios of bank deposits to national income (in 1970) for some selected countries are shown in Table VI.

The rate of growth of bank deposits was about 19.4 per cent in 1970-71. If, as anticipated, national income increases at 6 per cent per year and the pace of deposit mobilization is kept up, the ratio of bank deposits to national income would be more than 34 per cent by 1975-76, about the same as in France and even higher than in the U.K.

The bulk of the deposits, i.e. about 57.3 per cent, is owned by individuals. Business, including industry, trading, financial orga-

TABLE VI

|         | <i>Bank deposits as %<br/>of national income 1970</i> |
|---------|-------------------------------------------------------|
| U.S.A.  | 49.8                                                  |
| U.K.    | 25.8                                                  |
| France  | 35.5*                                                 |
| Germany | 60.4                                                  |
| Canada  | 43.3                                                  |
| Japan   | 87.0                                                  |
| India   | 18.0                                                  |

\*Relates to 1969.

nization, etc. account for only 23 per cent of the deposits. The banking system thus acts largely as an intermediary between households and business on the one hand, and households and Government on the other. The composition of deposits was as follows:

TABLE VII

|                  | <i>Percentage to total</i> |
|------------------|----------------------------|
| Demand deposits  | 25.5                       |
| Savings deposits | 24.6                       |
| Time deposits    | 49.9                       |

Demand deposits do not earn any interest. Interest on savings deposits is 4 per cent and varies with the maturity period on fixed deposits. The rates for selected maturity periods are as follows:

TABLE VIII

|          | <i>Rate of interest<br/>(per cent)</i> |
|----------|----------------------------------------|
| 3 months | 4.1/4                                  |
| 1 year   | 6                                      |
| 3 years  | 7                                      |
| 5 years  | 7.1/4                                  |

Banks have to maintain a certain proportion of their deposits in liquid assets like gold, cash, balances with the Reserve Bank and approved Government securities. The legal minimum is 28 per cent cash ratio and 25 per cent investment in gold, approved securities, etc. The Reserve Bank has also devised a system of differential interest rates in terms of which interest on borrowings from it are charged at a rate higher than the bank rate if liquidity ratio is below a certain level. Against the legal 31 per cent, the minimum liquidity ratio for purpose of borrowing from the Reserve Bank at the bank rate is 34 per cent.

Investment in Government securities is normally in short securities. This is so possibly because the potential capital loss in the case of short securities consequent on rise in the rate of interest is less. Besides, the liabilities of banks are mainly short-term and, consequently, banks would like to maintain short-term assets also. For example, of the fixed deposits, 59.3 per cent were for less than 1 year and 93.8 per cent for less than 5 years. Correspondingly of the total investments in Government securities, 56 per cent were short-term, maturing in less than 5 years.

The bulk of the deposits are used to give credit. This consists of advances, largely short-term and bills. Medium term advances are hardly about 10 per cent of the total. At the end of March 1972, the composition of credit of scheduled commercial banks was as follows:

TABLE IX

| <i>Type of Credit</i>             | <i>Rs. crores</i> | <i>Percentage to total</i> |
|-----------------------------------|-------------------|----------------------------|
| Loans, cash credit and overdrafts | 4,161             | 89                         |
| Bills:                            |                   |                            |
| Inland                            | 825               | 16                         |
| Foreign                           | 222               | 4                          |

Bills are not a popular instrument of credit. This is so possibly because of the absence of financial discipline and planning in business operations. In spite of repeated efforts made by the Reserve Bank, the Bill Market Scheme has not yielded any worthwhile results. As such, flexibility and control over the money market have been somewhat blunted. In November 1970, the Reserve Bank introduced a new Bills Discounting Scheme. The outstanding amount of bills held by the Reserve Bank had reached a peak of Rs. 45 crores on April 7, 1972.

The distribution of bank credit showed a great element of skewness. At the time when the banks were nationalized, nearly 66 per cent of the credit was taken up by industry and another 19 per cent by trade. Agriculture had a paltry share of 3 per cent. This inequity in the distribution of bank credit, though historically justified in terms of commercial banks' specialization, was possibly the main consideration in the nationalization of 14 major banks in 1969. The pattern of distribution of bank credit has since considerably changed in favour of priority sectors like agriculture, small scale industries, exports, retail trade, transport operators, professionals, self-employed and education. The total amount of credit to these

sectors rose from Rs. 438.5 crores in June 1969 to Rs. 961 crores at the end of December 1971.

Bank credit reveals a marked seasonal pattern, though lately the pitch of fluctuations has considerably reduced. In the busy season, November-April, there is a steep rise in bank credit followed by a decline, though of a lower magnitude in the slack season, May-October. This seasonal pattern reflects the predominant agricultural character of the economy. Thus advances against paddy and rice, wheat, sugar, gur, ground-nuts, jute, cotton, etc. rise in the busy season and fall in the slack season. No such seasonal pattern is however, discernible in respect of advances against industrial goods like textiles, iron and steel, chemicals and so on. Since the proportion of credit against industrial goods has increased in recent years, the seasonal character of advances has also been mitigated. Seasonal trends in credit induce counter variations in other assets. Thus in the busy season there is generally a reduction in Government securities and an increase in borrowings from the Reserve Bank.

Interest on bank advances has stepped up quite sizably in recent years. Currently, banks charge about 11 per cent interest on general purpose advances. But certain categories of advances, for example, exports, obtained finance at a concessional rate. There is no ceiling on interest on advances charged by commercial banks. In respect of advance against cotton which was object to price rise, the Reserve Bank stipulated 13 per cent interest. Recently a scheme of differential interest rates has also been introduced which consciously discriminates between different categories of borrowers. A concessional rate of interest at 4 per cent is stipulated to certain categories of weaker sections of the community.

## VI. Foreign Banks

At the time when the Indian Central Banking Inquiry Committee reported in 1931, the financing of foreign trade was done almost exclusively by what were called exchange banks. The registered office of these banks were located outside India. Pre-emption of this business was not a matter of legal protection but a mere historical practice from the days of the East India Company. The exchange banks did not confine themselves merely to financing of foreign trade although this was their principal business. They also accepted deposits, purchased and discounted bills, etc. There were 18 exchange banks in 1928 with £ 53.3 million deposits in India.

With the progress of Indian banks and the establishment of branches abroad, the monopoly of foreign banks in the financing of foreign

trade was broken. What is more, the exchange control made it compulsory for all foreign exchange dealers to operate through the Reserve Bank. It has to be recognized, however, that foreign banks have a 'global affiliation' which facilitates collaboration between foreign and Indian businessmen and arrangement of loans in foreign currencies. It is in terms of this specialization that the Reserve Bank decides on the number and location of branches of foreign banks.

Mostly, the branch network of foreign banks is confined to port towns. The scope for branch expansion of foreign banks appears to be extremely limited. In the two years following nationalization of 14 major banks, the total number of branches of scheduled commercial banks increased by 3,716 but branches of foreign banks by only 1.

Banking laws do not make any differentiation between Indian banks and foreign banks. When banks were brought under social control informally in 1968, and through legislation in 1969, foreign banks, like Indian banks, were required to constitute advisory boards (consisting of Indians) with a majority of persons having special knowledge of or practical experience in accountancy, agriculture and rural economy, small scale industries, co-operation, banking, economics, finance and law. It was made incumbent on foreign banks informally to have as their 'own funds deployed in Indian business' an amount equivalent to 3.5 per cent of their deposits in India by creating reserves, granting loans in foreign currency to Indian parties or making deposits with the Reserve Bank in its foreign account. Foreign banks are required to maintain a credit deposit ratio of not more than 80 per cent subject to deduction in respect of export bills, etc.

There were 14 foreign banks in India accounting for about 9 per cent of the total deposits of scheduled commercial banks at the end of March 1972. Their principal assets and liabilities were as follows:

TABLE X

|                                                                         | <i>Rs. crores</i> |
|-------------------------------------------------------------------------|-------------------|
| <b>Liabilities</b>                                                      |                   |
| Demand deposits                                                         | 216               |
| Time deposits                                                           | 410               |
| <b>Assets</b>                                                           |                   |
| Cash in hand, balance with R.B.I. and other banks,<br>and money at call | 48                |
| Investment in Govt. securities                                          | 172               |
| Bank credit                                                             | 489               |

There are not many significant differences in the composition of assets and liabilities of foreign banks and Indian commercial banks except, in a small measure in respect of:

- (a) the ratio of bank credit to bank deposits, and
- (b) the ratio of bills to total bank credit.

The ratio of bank credit to bank deposits in the case of foreign banks was much higher than in the case of Indian banks. For example, at the end of March 1961 the ratio of bank credit to deposits was 107 per cent in the case of foreign banks compared to 71 per cent in the case of Indian scheduled commercial banks. Since then the credit deposit ratio in respect of foreign banks has been brought down to 78 per cent (March 1972), compared to 73 per cent in respect of Indian scheduled commercial banks.

The other marked difference is in the composition of bank credit. At the end of April 1972, this composition was as follows:

TABLE XI

|                                             | <i>Foreign<br/>banks</i> | <i>Indian scheduled<br/>commercial banks</i> |
|---------------------------------------------|--------------------------|----------------------------------------------|
| Percentage of loans to credit               | 75                       | 80                                           |
| Percentage of inland bills to total credit  | 12.5                     | 16                                           |
| Percentage of foreign bills to total credit | 12.5                     | 4                                            |

The differences in the pattern of assets reflect mainly the nature of specialization. Foreign banks allocate a large part of their business to financing of foreign trade, joint ventures, etc. Hence a larger percentage of credit is absorbed by purchase and discount of foreign bills. Foreign banks are more involved in the international economic aspects rather than in purely internal financial affairs.

### VIII. Indigenous Banks

Money lenders and indigenous bankers comprised the core of the financial system until recently. In 1930, they accounted for nearly 90 per cent of the total credit. The growth of banking has since been at a relatively faster pace. As a result, indigenous bankers today hardly account for 10 per cent of the credit operations in the money market.

The number of money lenders and indigenous bankers was placed at 33,939 in the census of 1961. Of these, indigenous bankers are located primarily in urban areas and come largely from certain communities like *Multanis*, *Shroffs*, and *Marwaris* in the Western, Eastern and Northern India and *Sindhi Multanis*, *Nattukottal Chettians* and Brahmins of Kallidaikurichy in South India. Indigenous bankers are concentrated in the industrial areas of Bombay, Ahmadabad, Madras, etc.

Indigenous bankers finance primarily those sectors which are not able to get credit from banks. These are traders, both retailers and wholesalers, small scale industries, etc. Some of the borrowers prefer indigenous bankers to commercial banks because the former provide informal and personalized services, are flexible in their approach and process proposals without delay. They mainly function on the basis of trust. The rates of interest are higher than those charged by commercial banks but lower than those charged by money lenders.

There are about 400 firms of *Multani Shroffs*, 253 of which operate in Bombay. The principal vehicle of credit used by *Multani Shroffs* is the *hundi*. The *Multanis* share risk when large loans are involved. Traders and small scale industries are the principal borrowers. The data collected by the Working Group of the Banking Commission indicate that the main sources of finance to *Multani Shroffs* are owned capital, bank borrowings and deposits. In respect of 319 firms, the components of capital employed were as under:

TABLE XII

| Sources         | Rs. crores  |
|-----------------|-------------|
| Bank borrowings | 20.2        |
| Owned capital   | 16.4        |
| Deposits        | 3.7         |
|                 | <u>40.3</u> |

The *Multani Shroffs* have a close nexus with the banking system. Nearly a half of the capital employed is borrowed from commercial banks. The vast bulk of the other half is owned capital. Deposits are relatively insignificant. The *hundi* is the main instrument of credit and usually has a tenure of three months. As such, the total turnover of *Multani Shroffs* would be about Rs. 160 crores.

Unlike *Multani Shroffs*, the operations of the *Gujarati Shroffs* are akin to those of commercial banks. The bulk of the finance comes from current and fixed deposits. However, some of the *Shroffs* also combine commission agency business. The *hundi* is the principal instrument of credit and is used largely for marketing and movement of goods. In Ahmadabad, there are about 150 *Shroffs* who do exclusively financial business. In Bombay, most of the *Gujarati Shroffs* also combine other interests. The organization often takes the form of partnership, some with branches in rural areas. The financial structure of 350 *Gujarati Shroffs* (Ahmadabad and Bombay) in 1969 was as follows:

TABLE XIII

|                     | <i>Owned capital</i> | <i>Deposits</i> | <i>Total resources</i> | <i>Advances</i> |
|---------------------|----------------------|-----------------|------------------------|-----------------|
| 150 Ahmadabad firms | 5.10                 | 11.0            | 16.10                  | 14.0            |
| 200 Bombay firms    | 10.00                | 15.0            | 25.0                   | 22.0            |
| Total               | 15.10                | 26.0            | 41.10                  | 36.0            |

The *Gujarati Shroffs* pay interest at the rate of 4 to 6 per cent on demand deposits; the commercial banks do not pay any. The *Gujarati Shroffs* also accept term deposits the interest on which goes upto 11 per cent or so. There is a call market for funds which redistributes, among the *Shroffs*, surplus funds for short periods.

The total *hundi* business of *Gujarati Shroffs* in Bombay and Ahmadabad is estimated at Rs. 600 and Rs. 300 crores respectively. Recently some of the *Gujarati Shroffs* formed themselves into groups of partnership firms and provide, in line with the business of *Marwari Shroffs*, short-term finance to retail trade, small scale industries, etc., against *usance hundis*.

The *Chettiars* did banking business not only in South India but also in Burma, Sri Lanka and Indo-China. Estimates about the working capital of the *Chettiars* varied from Rs. 36 crores to Rs. 105 crores. The bulk of these were owned funds. Similarly, reliable estimates about the capital resources of the *Kallidaikurichi* Brahmins are not available. But their operations were much smaller than those of the *Chettiars*. Both *Chettiars* and *Kallidaikurichi* Brahmins have shrunk in size and lost much of their business to *Multani Shroffs*. A few *hundi* firms have gone into banking business. Presently, there are less than 50 *Chettiar* firms doing *hundi* business.

The number of indigenous bankers known as *Marwari Kayas* in Assam is estimated at 400. They provide facilities mostly to tea gardens. They also combine other functions like retail trading, commission agency, etc.,

Indigenous banking is not an isolated sector of the money market. There is considerable inter flow of funds between indigenous bankers and commercial banks. The discounting of *hundis* by indigenous bankers enables the commercial banks to invest surplus funds for short periods. This opens a source of supplementary finance to indigenous bankers, particularly *Multani Shroffs*. The rate of interest charged by indigenous bankers is higher, because first, the interest rate is exposed more fully to market forces, and secondly, the element of lender's risk is greater. However, an effort has been made by some States to put a ceiling on interest rates through legislation. The Bombay Money Lenders Act puts the

ceiling at 17 per cent (since July 1971). The Mysore Money Lenders Act, similarly, imposes a ceiling of 18 per cent. With the ceiling rates and the rise in the cost of bank credit, the indigenous bankers' margins have been somewhat squeezed. The margin between commercial banks' discount rate of *hundis* and the lending rates of *Multanis* is even less than the differential between deposit rate and advance rate of commercial banks.

The indigenous bankers are largely outside the ambit of any credit policy. The Reserve Bank's attempts to establish direct links with indigenous bankers failed and all moves to integrate this unorganized sector with the rest of the financial system proved infructuous. The Banking Commission (1972) has recommended a closer link between indigenous bankers and scheduled commercial banks. The Reserve Bank control and supervision in that case will be indirect.

### VIII. Insurance

The first step in regularizing insurance business was taken in 1912 when the Indian Life Insurance Companies Act was passed. The provisions of the Act soon proved inadequate and a comprehensive Insurance Act was promulgated in 1939. The Act was substantially amended in 1950. In 1956, life insurance companies numbering about 250 were nationalized. A single corporation called the Life Insurance Corporation of India was set up to take over the entire life insurance business. General insurance companies remained in the private sector. In 1968, a scheme of social control was introduced in the form of the Insurance Amendment Bill which was later passed by Parliament. These measures were considered insufficient and in 1971 Government took over management of general insurance companies through an ordinance. The companies were finally nationalized in 1972. Thus, the entire insurance business - life and general - is now in the public sector. While life insurance is handled by a single corporation, general insurance will be entrusted to four separate corporations to ensure competition.

The total business in force of the Life Insurance Corporation (L.I.C.) at the end of March 1970 was Rs. 6,425 crores, nearly a fifth of the national income. The book value of the investment was Rs. 1,529 crores comprising stock exchange securities, loans, deposits and contribution to initial capital of the Unit Trust of India. The distribution of investments in India was as shown in Table XIV.

Life insurance is an important outlet for the savings of the households. In 1969-70, about 11 per cent of these savings (held in financial assets) were invested in life insurance policies. The L.I.C. has

TABLE XIV

| <i>Sectors</i>      | <i>Percentage to total</i> |
|---------------------|----------------------------|
| Public sector       | 73.6                       |
| Co-operative sector | 9.5                        |
| Joint sector        | 0.4                        |
| Private sector      | 16.5                       |

become a crucial savings institution, and consequently, the pattern of its assets influences the overall distribution of funds in the economy.

The L.I.C. is a major customer for Government securities. In 1969, nearly 11 per cent of the Central Government securities and 23 per cent of the State Government securities were held by the L.I.C. What is important, the share of the L.I.C. in the public debt has been increasing over the years. The market for Government securities is now confined almost wholly to institutional investors including the L.I.C. provident funds and banks.

There were 67 Indian and 45 non-Indian insurance companies registered under the Insurance Act 1938 engaged in general insurance business. Their net premium income during the year 1969 was Rs. 106.5 crores and Rs. 16.7 crores respectively. For Indian insurers, excluding the L.I.C., the excess of income over expenditure was Rs. 13.09 crores, Rs. 5.81 of which represented an increase in reserves.

The composition of assets at the end of December 1969 was as follows :

TABLE XV

| <i>Type of Asset</i>                  | <i>Indian Insurers</i> |                         | <i>Non-Indian Insurers</i> |                         |
|---------------------------------------|------------------------|-------------------------|----------------------------|-------------------------|
|                                       | <i>Amount</i>          | <i>Percent to total</i> | <i>Amount</i>              | <i>Percent to total</i> |
| Government securities                 | 11.92                  | 6.5                     | 1.93                       | 6.8                     |
| Debentures of Indian companies        | 14.01                  | 7.5                     | 1.39                       | 4.9                     |
| Preference shares of Indian companies | 13.35                  | 7.1                     | 0.74                       | 2.6                     |
| Ordinary shares of Indian companies   | 42.06                  | 22.4                    | 3.22                       | 11.4                    |
| Deposits, cash and stamps             | 43.37                  | 23.1                    | 9.99                       | 35.3                    |
| Loans                                 | 4.71                   | 2.4                     | 1.25                       | 2.6                     |
| Agents' balances outstanding          | 36.49                  | 19.4                    | 3.04                       | 10.8                    |
| Property and other assets             | 18.77                  | 19.0                    | 6.77                       | 20.3                    |

There is considerable difference in the pattern of investment between the L.I.C. and general insurance. While the former invested the bulk of the resources in Government securities—Centre and States—the

latter used a larger part of the resources for investment in debentures, preference shares and ordinary shares of Indian companies. However, in absolute terms the resources at the disposal of the L.I.C. are larger. The L.I.C. holds over 9 per cent of the total number of shares quoted on stock exchanges.

The L.I.C. did not, until recently, exercise voting power in respect of shares held by it. The investment was purely financial. But with the promulgation of guidelines for conversion of loans into equities, it has been provided that the financial institutions should exercise their powers as shareholders more discreetly. This has put considerable voting power in the hands of the L.I.C.

The L.I.C. and the general insurance companies act as financial intermediaries for mobilizing capital for the private corporate sector. They underwrite capital issues. In 1970-71, of the Rs. 30.5 crores of capital underwritten, about 14.2 per cent was underwritten by the L.I.C. and 3.1 per cent by the general insurance companies. Of the total capital underwritten by them, 77 per cent was subscribed either as investors or as underwriters.

## VI. Stock Exchanges

The first organized Stock Exchange was established in Bombay in 1887 and was styled as 'The Native Share and Stock Brokers' Association'. Even fifty years before the Exchange was established there were considerable dealings in securities. The number of brokers involved in this business numbered about 6 in 1850, and after the share mania induced by the American Civil War, increased to 200-250 in 1865. When the Stock Exchange was constituted in 1887 there were 318 members on the list.

The Stock Exchange in Bombay was followed by the Ahmadabad Share and Stock Brokers' Association in 1894, Calcutta Stock Exchange Association in 1908 and the Madras Stock Exchange Association (Pvt.) Ltd. in 1937. A number of other stock exchanges had sprung up during the First and the Second World Wars. But most of these were makeshift stock exchanges and collapsed soon after. When the Securities Contracts (Regulation) Act 1956 was passed, only 7 stock exchanges, viz., Bombay, Ahmadabad, Calcutta, Madras, Delhi, Hyderabad and Indore, received recognition. The Bangalore Stock Exchange was registered in 1957 and recognized in 1963. There are thus 8 stock exchanges, only 5 of which were permitted to undertake forward dealing.

The Securities Contract (Regulation) Act 1956 is the major comprehensive legislation which regulates stock exchanges. The control

was operated earlier through the Bombay Securities Contract Control Act 1925 and the Defence of India Rule 94 C. The Securities Contract (Regulation) Act 1956 allows only recognized stock exchanges to carry on business.

Stock exchanges have to be approved by Government which has powers to amend any rule and frame new ones. Government can also institute enquiries into the affairs of stock exchanges. Excepting spot delivery, all other security contracts, to be legal, have to be effected through members of recognized stock exchanges. The Act empowers Government to prohibit any type of dealings on any stock exchange to prevent speculation. It is under these provisions that forward dealing in shares was banned with effect from June 27, 1969.

The Stock Exchange is not a source of finance to industry or Government. It is a market where securities like equity shares, preference shares, debentures, gilt-edged etc., are traded. By keeping the market active through spot and forward dealings, the Stock Exchange imparts liquidity to securities, promotes continuity of price, ensures free negotiability and thus makes them an attractive investment.

Securities quoted on stock exchanges can be classified into either cleared securities or non-cleared securities. Both types of securities can be dealt in for spot deliveries; but business for clearing can be done only in respect of the former. To get on the clearing list, securities must be fully paid up. Equity shares must have been admitted to dealings for at least three years to get on the clearing list. Besides, the company must be of public importance with paid-up capital of not less than Rs. 25 lakhs and the market value not less than Rs. 1 crore, at least 49 per cent of it being held by the public.

In 1969, there were 1,974 companies whose securities (equities, preference shares and debentures) were quoted on the 8 recognized stock exchanges. The paid-up capital of these securities was Rs. 2,560 crores and their market value Rs. 3,558 crores. The relative position of different stock exchanges is shown in Table XVI.

The industry-wise composition of securities has substantially changed in recent years. When the stock exchanges were set up, the vast bulk of the shares in Bombay and Ahmadabad were cotton textiles and in Calcutta, jute, tea and coal. With the industrialization of the country, a variety of new industries have emerged. The more prominent of these are engineering and chemicals. In 1969, engineering accounted for about 25 per cent of the market value of capital employed by way of equities, preference shares and debentures, and chemicals, another 10 per cent. The share of cotton textiles was 11 per cent and that of jute and coal even smaller.

TABLE XVI

|           | <i>No. of<br/>listed<br/>companies</i> | <i>No. of stock<br/>issued<br/>listed</i> | <i>Market<br/>value of<br/>capital<br/>Rs. crores</i> | <i>Paid up<br/>value of<br/>capital<br/>Rs. crores</i> |
|-----------|----------------------------------------|-------------------------------------------|-------------------------------------------------------|--------------------------------------------------------|
| Bombay    | 570                                    | 1,042                                     | 1,485                                                 | 1,014                                                  |
| Calcutta  | 641                                    | 1,066                                     | 897                                                   | 655                                                    |
| Madras    | 361                                    | 673                                       | 405                                                   | 348                                                    |
| Ahmadabad | 127                                    | 272                                       | 307                                                   | 196                                                    |
| Delhi     | 158                                    | 308                                       | 316                                                   | 234                                                    |
| Hyderabad | 38                                     | 66                                        | 57                                                    | 49                                                     |
| Indore    | 14                                     | 19                                        | 34                                                    | 17                                                     |
| Bangalore | 65                                     | 108                                       | 57                                                    | 47                                                     |

The bulk of the shares are held by individuals either directly or through joint stock companies. The pattern of ownership was as follows:

TABLE XVII

| <i>Class of shareholders</i> | <i>Percentage of shares held</i> |
|------------------------------|----------------------------------|
| Individuals                  | 45.58                            |
| Joint stock companies        | 32.76                            |
| Financial institutions       | 18.53                            |
| Life Insurance Corporation   | 9.02                             |
| Others                       | 3.13                             |

Share holding had attracted considerable public interest. This was particularly true of small investors. Between 1959 and 1965, for example, the total number of individual shareholders (accounts) in respect of 48 companies increased from 3,22,497 to 4,09,757. More than 93 per cent of the increase was in the small shareholder class holding shares of value less than Rs. 5,000. In terms of value, more than 64 per cent of the additional shares were held by this class. Unfortunately, however, this interest was short-lived.

The market for securities showed considerable activity in the mid-fifties and the early-sixties. Since 1962, however the market has been considerably subdued. The index number of variable dividend securities on base 1961-62=100 declined to 76 in 1965-66 and regained its level only in 1970-71. The index slumped again in 97.6 at the end of May 1972. In these 10 years, all other prices of commodities and assets had substantially increased, making industrial securities—equities, preference shares and debentures—an unattractive investment. This was possibly why companies were unable to raise adequate finance from the open market. The total capital raised by non-Government companies in 1971 was only about a half of that in

1961. Raising finance from the public has become a difficult task, and, as such, companies have been forced to depend, in a high measure, on financial institutions.\*

Public interest in shares has been further weakened by factors which have impaired their liquidity. Banks are normally reluctant to advance against blocks of shares. For loans exceeding Rs. 50,000 secured by shares, the latter have to be transferred in the name of banks. This has made shares a poor security for bank advances and consequently diluted public interest in share-holding.

Since a large part of the finance for industry currently comes from financial institutions, it was suggested by the Dutt Committee that the financial institutions should have the option to convert a part of the loans into equities. These powers have now been given to the financial institutions and the conversion clause is usually inserted in all loan contracts exceeding Rs. 50 lakhs.

---

\* The principal institutions include I.D.B.I., I.F.C./S.F.C.s, and U.T.I. for long-term and medium-term funds and scheduled commercial banks for short-term funds.

## CHAPTER XII

# CURRENCY AND PRICES

## A. CURRENCY

### I. Historical Review Of Currency

The currency history of India since the early part of the nineteenth century is of unusual interest and significance in monetary annals. During this period, India successively passed through a variety of phases with regard to monetary standards. Starting with a silver standard in the middle thirties of the nineteenth century, the country had a 'managed' inconvertible silver currency (1893-1898), gold exchange standard (1899-1916), a mixed standard (1917-1926), gold bullion standard (1927-1931), sterling exchange standard (1931-1947), and finally, after independence, a managed rupee standard. The crux of the monetary controversy during the last century or so has consisted in the twin issues of the choice, firstly, of a workable monetary standard based on silver, gold or sterling and, secondly, of an appropriate rate of exchange between the domestic currency, viz., the rupee, and the prevailing standard. Likewise, India's currency experience embodies the working of both the Fixed Fiduciary System and the Proportional Reserve System for the issue of currency. Under a Fixed Fiduciary System, the volume of currency that can be issued against domestic Government securities cannot exceed a stipulated statutory maximum whereas, a Proportional Reserve System lays down the minimum proportion of currency which has to be covered by metallic reserves in the form of bullion or coin and foreign securities.

The origin of the modern Indian monetary system may be traced to the Gold and Silver Coinage Act of 1835 whereby the East India Company established the silver rupee (180 grams in weight and 11/12 fine) as the sole legal tender currency for payment throughout its territories. The face value of the rupee was equal to its intrinsic value and the mints were opened to its free coinage. This was a form of monometallic silver standard to replace the variety of bimetallic standards prevailing in the Company's territories. However, the Act of 1835 also authorized the coinage of gold *mohurs* and specified gold coins at market value, if required by the public. Although the Presidency Banks of Bengal, Bombay and Madras were authorized to issue notes payable to bearer on demand, their circulation was practically confined to the Presidency towns. Even after the enactment of the Paper Currency Act of 1861, while notes were issued to the public without limit in exchange for rupees or British gold coins, they were declared unlimited legal tender only within their respective circles of issue. The Act of 1861 provided

for a fixed maximum fiduciary issue of notes against Government of India securities upto Rs. 4 crores, a limit which was successively raised by special Acts to Rs. 6 crores (in 1871), Rs. 8 crores (in 1890), Rs. 10 crores (in 1897) and Rs. 12 crores (in 1905). The remainder of the paper currency circulation was fully backed by bullion and coin. Government securities, gold and silver coin and bullion, against which notes were issued, were kept in a reserve called the Paper Currency Reserve.

The efficient working of the silver standard was rendered increasingly difficult with the depreciation of silver that accompanied its rising production as well as falling demand consequent upon the demonetisation of silver by several countries. The corresponding appreciation of gold with its smaller output and enhanced demand from countries adopting the gold standard further complicated the situation. The depreciation in the value of the rupee also created a difficult budgetary problem for the Government of India which had to mobilize larger rupee resources, mostly through higher taxation, to meet the Home Charges in England on account of interest on sterling debt, payments for Government stores, pensions and other items. Likewise, the fluctuations of the exchange rate affected not only foreign trade but also the inflow of foreign capital, enterprise and personnel.

Recognizing the need for monetary reform, the Government of India appointed in 1892 the Herschell Committee and, in pursuance of its recommendations, passed the Act of 1893. Under this Act, the mints were closed to the free coinage of both silver and gold, although the Government retained the power to coin rupees on their own account. The Act also provided for receipt of gold at the mints at the rate of 16d. to the rupee and the issue of notes in exchange for gold. Government also decided that there should be a transitional period before an attempt was made to coin gold in India and establish a full-fledged gold standard as recommended by the Herschell Committee.

Instead, following a period of transition, there came to be established, under the Act of 1899, in the light of the recommendations of the Fowler Committee (appointed a year earlier) and as administratively modified, a gold exchange standard. The main features of the currency system which thus came to be established and which remained in operation till 1916, were: (a) the sovereign was unlimited legal tender, at 1s. 4d. to the rupee; the authorities also issued sovereigns and half sovereigns to a limited extent but undertook no obligation to give them in exchange for notes or rupees; (b) the rupee was unlimited but inconvertible legal tender; (c) the rupee was maintained at 1s. 4d. by purchases and sales of sterling at fixed rates, largely through the system of Council Drafts and Reverse Council Drafts whereby the demand for rupees/sterling was met by payments of sterling/rupees into the Paper Currency Reserve, the Gold Standard Reserve or the Secretary of State's Balances.

In accordance with the recommendations of the Committee a reserve — called the Gold Standard Reserve — was created out of the profits of the coinage of silver rupees; this was designed to maintain the external value of the rupee. A change was also made in the composition of the Paper Currency Reserve. Since 1905 a part of the invested portion (upto Rs. 2 crores) of the Paper Currency Reserve was also authorized to be held in sterling securities, the remaining portion being invested in Government of India securities.

The outbreak of World War I made it difficult to maintain the exchange value of the rupee; there was a phenomenal rise in the price of silver leading to the intrinsic value of the rupee exceeding its face value. The price of silver rose from 27½d. per standard ounce in 1915 to above 43d. in August 1917. At this price (43d.) the exchange value of the rupee was equivalent to its bullion value and, with every rise in the price of silver above 43d., the exchange value of the rupee also had to be raised *puri passu*. The Gold Exchange Standard which depended, among other things, on the rupee remaining a token coin thus virtually broke down. Accordingly, several corrective measures were taken apart from allowing the exchange rate to rise, such as the purchase by Government of 200 million fine ounces of U.S. silver, a ban on import of silver on private account, prohibition of melting of gold and silver coins in India, and the issue of an Ordinance (June 1917) requiring all imported gold to be sold to the Government. The fiduciary note issue limit was also increased from Rs. 14 crores in 1911 to Rs. 120 crores in 1919.

In 1919 the Babington Smith Committee was appointed to examine the effects of the war on the Indian exchange and currency system and to make recommendations to ensure a stable exchange. The committee's main recommendations, which were accepted by the Government in 1920, were to fix the exchange value of the rupee in terms of gold at 2 s. (i.e. one rupee for 11.30016 grams of fine gold) and to prescribe a minimum of 40 per cent metallic backing for the paper currency with a maximum fiduciary issue of Rs. 120 crores for a limited period. Besides, provision was to be made to issue notes upto Rs. 5 crores against export bills over and above the fiduciary issue to meet seasonal demands. The attempt to stabilize the exchange rate of the rupee at 2 s. (gold) failed because of an unfavourable balance of trade and the rapid fall in sterling relatively to rupee prices. The adjustment took the form of a fall in the exchange rate rather than in internal prices. After May 1925, the rupee ratio was maintained around 1s. 6d. and the Government introduced the system of purchase of sterling in India through the Imperial Bank from exchange banks and recognized firms in order to replace gradually the sale of Council Drafts in London, i.e. the system where by sterling used to be tendered in London for credit to the Secretary of State

against rupee paid in India.

Following the return of England to the gold standard in April 1925, the Government of India appointed the Hilton Young Commission in August, 1925 to examine and report whether any modifications were desirable in the Indian currency system. Its report and recommendations were the most far-reaching of those of all the Currency Commissions appointed in India till that time. The commission rejected the gold exchange standard chiefly on the ground that it was too complicated to secure the confidence of the general public since the backing which the system supplied for the currency was too abstract to be readily intelligible to the majority. The commission, therefore, recommended the establishment of a gold bullion standard (without internal circulation of gold coins) and an exchange rate (fixed in terms of gold) of 1 s. 6 d. for the rupee. It also proposed that the control and management of currency be entrusted to a Central bank to be called the Reserve Bank of India and that the Paper Currency Reserve and the Gold Standard Reserve should be amalgamated; it also recommended that not less than 40 per cent of the combined reserve should consist of gold and gold securities. The recommendations of the commission were followed by acute controversy which centred for the most part on the choice of the 1s. 6d. ratio and, to a lesser extent, on the organization and powers of the proposed Reserve Bank.

The Currency Act of 1927 established the 1s. 6d. (gold) ratio by imposing statutory obligations on the Government to purchase gold in bars (containing not less than 40 tolas or 15 ozs. or 466.55 grams) at Rs. 21-3-10 per tola and to sell gold for delivery at Bombay or sterling for delivery in London in amounts of not less than 1065 tolas (400 ozs. or 12421.95 grams) of gold or the sterling equivalent thereof. The retention by the Government of the option of selling sterling against rupees meant that the standard adopted was not a gold bullion standard but a gold exchange standard so long as sterling was convertible into gold as it was upto September 21, 1931, and a sterling exchange standard thereafter.

The proposal for the creation of the Reserve Bank, which was referred to a Select Committee of the Indian Legislature, was dropped in February 1928 owing to differences between the Government and the Opposition on the organization of the bank, particularly regarding the composition of the directorate and its creation as a shareholders' bank.

With the delinking of sterling from gold on September 21, 1931 when England went off the gold standard, the rupee was linked to sterling at 1s. 6d. The Government of India assumed the statutory obligation to sell and buy sterling against rupees at this rate. Thus in law and practice India adopted a formal sterling exchange standard which was retained even after the creation of the Reserve Bank of India in 1935

and continued to be in operation until the creation of a new international monetary system under the auspices of the International Monetary Fund.

The establishment of the Reserve Bank of India is a landmark in the monetary history of India not only because it set up for the first time a unified monetary authority to control both currency and credit but also introduced a basic change in the currency system by replacing the Fixed Fiduciary System by a Proportional Reserve System comprising a minimum cover of gold (in coin and bullion) or sterling securities of 40 per cent and of not less than Rs. 40 crores in value. The Reserve Bank assumed the liability of the currency notes of the Government of India and the corresponding assets in the Gold Standard Reserve and the Paper Currency Reserve, which were maintained separately heretofore.

Although the Proportional Reserve System imparted the necessary flexibility, particularly for expanding the note issue, a contraction in foreign exchange reserves below the minimum level necessary to maintain a given note circulation necessitated a contraction of note issue to a larger extent than the fall in reserves. Consequently, the Bank kept a larger proportion of gold and sterling reserve, around 52-58 per cent during the years 1935-39, than the minimum of 40 per cent.

But, in keeping with the general trend of central banking legislation to delink foreign reserves from the note issue consequent upon a growing recognition that the main purpose of foreign exchange reserves is to meet deficits in the balance of payment, the Proportional Reserve System was again modified by the Reserve Bank of India (Amendment) Act, 1956. This provided for a minimum of foreign reserves in absolute amount of Rs. 400 crores in foreign securities and Rs. 115 crores in gold coin and bullion (valued at 2.88 grains of fine gold per rupee or Rs. 53.58 per 10 grams in terms of the official parity price agreed to by the International Monetary Fund). A further change made by the Reserve Bank of India (Second Amendment) Act, 1957 reduced the aggregate value of gold and foreign securities to be held in the Issue Department at any time to not less than Rs. 200 crores, of which the value of gold should not be less than Rs. 115 crores. The Act also empowers the Reserve Bank, with the previous sanction of the Central Government, to suspend the requirement of holding foreign securities, though not the provision for a minimum gold holding of Rs. 115 crores.

The backing for the rest of the note circulation can, under Section 33 of the Reserve Bank Act, comprise rupee coin, rupee securities of the Government of India and such bills of exchange and promissory notes payable in India as are eligible for purchase by the bank. But in practice the major part of the cover consists of Government of India rupee securities including *ad hoc* Treasury bills because commercial bills and promissory notes have not figured as assets owing to lack of a proper bill market.

India's assumption of membership of the International Monetary Fund in 1946 and its political independence since August 15, 1947 have brought about further important changes in the statutory basis as well as the operation of the currency system. This may now be described as a fully autonomous as well as a managed monetary system which provides for the requisite elasticity of money supply. This system is described later in the section on 'External Value of the Rupee'.

## II. Changes in the Volume and Composition of Currency

The volume of currency, although it is the most important means of payment, does not encompass the total monetary media in the community, which included bank deposits besides currency. It is therefore more meaningful to study the changes in the supply of money (*i.e.* legal tender currency with the public and bank deposits) as a whole rather than of currency alone. In the absence of a consistent time-series of money supply in India this section attempts to explain the mechanism and causes of variations in money supply since 1951. Apart from the convenience of availability of data for this period, it has the added advantage of being a period of active monetary management which fully exemplifies the working of the principal determinants of money supply.

Before analysing the variations in the supply of money, the concepts as used here may be briefly elucidated, particularly as these are operational definitions which vary with the purpose and scope of the analysis and do not have a universally accepted connotation. The most widely used concept of money supply is the one which refers to the magnitude of money supply with the public (*i.e.*, entities other than the Government and the banking system) comprising both legal tender currency (*i.e.*, notes and coin) and bank deposits.

Currency with the public comprises currency notes and coins in circulation excluding the balances of Central and State Governments held at treasuries and cash on hand of banks. Cash balances of Government are excluded because variations in them can be used as instruments for influencing the liquidity of the rest of the economy *i.e.*, off-setting any excess or deficiency of money supply with the private sector. The cash on hand of banks, including their balances with the Reserve Bank, is excluded because it constitutes the reserve against deposits and cannot therefore be used for purposes of transactions.

The deposit component of money supply consists of (a) demand deposits of banks, *i.e.*, those deposits which are withdrawable without notice such as deposits in current account and overdue fixed deposits, and (b) 'other deposits' with the Reserve Bank, which include items such as deposits of quasi-Government institutions and of foreign Central Banks as well as those balances of the International Monetary Fund (held in Account No. 2), which consist of working balances to meet the

**Fund's administrative expenditure in India.** Time deposits of banks and post-office savings deposits are excluded from money supply because these are essentially instruments of savings and are not ordinarily used as media of exchange. In the case of savings deposits with commercial banks, only that part which is withdrawable readily and constitutes the demand liability portion of such deposits is included. Recently the rules regarding withdrawal of savings deposits have been liberalized by many commercial banks, as a result of which the demand liability portion of such deposits has increased considerably.

Of the total currency with the public, one-rupee notes and small coins are the liability of the Government and form only a small portion of total currency. All other currency notes and 'other deposits' with the Reserve Bank are the liability of the Reserve Bank. Demand deposits are the liability of commercial banks. Thus money supply is largely the liability of the Banking System to the public and to a small extent that of the Government. However, there are other liabilities of the banking system, apart from demand deposits, *e.g.*, time deposits and items like capital and reserves of the banks as well as of the Reserve Bank which constitute the non-monetary liabilities of the banking system.

It will be clear from the above definitions that any transactions which increase either currency or deposit money (*i.e.* demand deposits) with the public will increase money supply; on the other hand, any transactions which increase time deposits, balances of the Government, cash on hand of the banks or non-monetary liabilities of the banking system, will decrease money supply. Since liabilities and assets of the banking system (including the Reserve Bank) must always be equal, changes in money supply, *viz.*, monetary liabilities of the banking system can be explained in terms of changes in (financial) assets, on the one hand, and changes in non-monetary liabilities of the banking system, on the other. Factors which account for such changes would thus explain variations in money supply, as indicated in the following equation:

Increase in money supply  
(Currency plus bank  
deposits).

Increase in financial assets of banking  
system minus increase in non-  
monetary liabilities.

and *vice versa* for a decrease in money supply.

There are five major factors which affect money supply with the public *i.e.* (1) net bank credit by the banking system to Government which is the net result of banks' and Reserve Bank's investments in Government securities and loans and advances to Governments, Central and State\*, offset by Government deposits with the Reserve Bank. (ii) net bank credit to the private sector comprising Reserve Bank of India

\*Since 1943-44, however, there have been no loans and advances by the Reserve Bank of India to the Central Government and therefore this item thereafter pertains only to State Governments.

Credit to the private sector and banks' net credit to the private sector which, in turn, is the result net of banks' loans and advances to the private sector offset by banks' time deposits; (iii) net foreign exchange assets of the Reserve Bank and other banks, viz. the excess of foreign exchange assets over liabilities. Changes in foreign exchange assets of the Reserve Bank affect money supply since a rise in these assets will be balanced by an increase in currency or deposit liabilities of the banking system to the public; a surplus in the balance of payments will therefore increase money supply and a deficit will reduce it; (iv) Government's net currency liability to the public, which indicates the changes in the public's holdings of one-rupee notes and small coins, and (v) net non-monetary liabilities of the banking system, which also include some errors and omissions. An increase in the first four factors will increase money supply, whereas an increase in the last one will decrease it. It may be pointed out that all the factors affecting money supply cannot be completely identified for want of adequate data. For instance, it is not possible to isolate the effect on money supply of the transactions of the foreign sector (comprising foreign companies, institutions and non-resident individuals) with the banking system.

The following Table presents a broad analysis of trends in money supply during the period 1951-52 to 1969-70 and factors affecting the variations:

| 4. Government's net currency liabilities to the public                                 | -52                                                             | +17                                                              | +81                                                             | +68                               |
| 5. Net non-monetary liabilities of the Banking Sector (including errors and omissions) | -58                                                             | -56                                                              | -276                                                            | -312*                             |

\*Excluding the charges due to revaluation of gold held in the Issue Department of the Reserve Bank from February 1, 1969.

It is evident that net bank credit to Govrenment has been the most important factor accounting for increase in money supply over the larger part of this period, though in some years such as 1966-67 (+Rs. 225 crores) and 1969-70 (+Rs. 249 crores) net bank credit to the private sector has been the major source of monetary expansion. On the other hand, the factor which tended to moderate the increase in money supply during this period, particularly during the Second Plan years, was a decline in foreign exchange assets.

Of the total money supply with the public, notes in circulation are the most widely-used medium of exchange, as the following figures show:

TABLE II  
As on Last Friday of March 1970

|                                          | (Rs. crores) |      |
|------------------------------------------|--------------|------|
| (1) Money supply with the public         | 6,379        |      |
| (2) Currency with the public             | 4,006        |      |
| (2) as % of (1)                          |              | 62.8 |
| (a) Notes in circulation                 | 3,799        |      |
| (a) as percentage of (2)                 |              | 94.8 |
| (b) Estimated circulation of rupee coins | 233          |      |
| (b) as percentage of (2)                 |              | 5.8  |
| (c) Estimated circulation of small coins | 123          |      |
| (c) as percentage of (2)                 |              | 3.1  |
| (d) Less cash on hand with banks         | 149          |      |
| (d) as percentage of (2)                 |              | 3.7  |
| (3) Deposit money with the public        | 2,373        |      |
| (3) as percentage of (1)                 |              | 37.2 |
| (e) Net demand deposit of banks          | 2,315        |      |
| (e) as percentage of (3)                 |              | 97.5 |
| (f) Other deposits with Reserve Bank     | 58           |      |
| (f) as percentage of (3)                 |              | 2.5  |

It is also interesting to note that, although currency (notes and coins) has been the predominant component of money supply in India, the (crude) ratio of deposit money to total money supply was as high as 43-46 per cent in the thirties and early forties of the present century.

TABLE III  
(in crores of Rs.)

| End of March | Money supply<br>with public<br>A | Currency<br>B | Deposits<br>C | % of C to A |
|--------------|----------------------------------|---------------|---------------|-------------|
| 1936         | 281                              | 160           | 121           | 43.1        |
| 1941         | 456                              | 246           | 210           | 46.0        |
| 1946         | 2,120                            | 1,334         | 786           | 37.1        |
| 1951         | 2,016                            | 1,406         | 610           | 30.3        |
| 1956         | 2,217                            | 1,571         | 646           | 29.1        |
| 1961         | 2,869                            | 2,098         | 771           | 26.9        |
| 1966         | 4,529                            | 3,034         | 1,495         | 33.0        |
| 1970         | 6,353                            | 4,009         | 2,344         | 36.9        |

Although the money supply data are not strictly comparable over these years, it would appear that, while both currency and deposit money

have been increasing, currency has risen at a more rapid rate than deposits over the period as a whole. This is partly due to the fact that the initial impact of absorption of the non-monetized sector into the monetary economy is reflected in a greater demand for currency than for deposits. However, with the banks opening branches in rural and semi-urban areas, rising interest rates offered on time deposits and liberalization of facilities to holders of these deposits, the increase in bank deposits has been greater in time than in demand deposits. More recently, the proportion of deposit money to total money supply has shown a rise indicating, among other factors, greater resort to bank money for mediating transactions.

### III. Monetary Policy Before Independence

The policy of the period before independence may, broadly, be divided into the period before and after the creation of the Reserve Bank of India in 1935 as the country's Central bank. In the pre-1935 phase there was, strictly speaking, no monetary policy in the sense of a purposive regulation of the quantity and price of money *i.e.*, the structure and level of interest rates, to sub-serve objectives of general economic policy. This was not only because of the absence of a Central bank acting as a unified monetary authority but even more because of India being a dependency which meant that the maintenance of a stable relationship with the currency of the metropolitan power was, as indicated in an earlier section, a prime criterion of monetary policy irrespective of its effects on internal economic activity. Consequently, most issues of currency policy revolved round the choice of the monetary standard and the maintenance of an appropriate rate of exchange. These issues were forced to a head when India, following the United Kingdom, left the international gold standard in September 1931, and the rupee was linked to the pound sterling at 1s. 6d. Even then the really significant question was not the choice of the standard since it was not practicable at the time to link the rupee either to gold or to establish it as an independent currency. The former alternative was ruled out not only because of the inadequacy of India's monetary gold reserves and the shrivelling up of the international gold bloc but also because the retention of the gold standard would have aggravated the economic depression in the country. Likewise, an autonomous rupee, apart from being not practical politics for a non-self-governing country, would not have been feasible in the absence of a central bank. Consequently, the effective choice of a monetary standard was limited to some variant of the sterling standard which was not unjustified because the major portion of India's external transactions was with the sterling area apart from the close financial links with Britain.

The really controversial issue was, therefore, whether the maintenance of the rate of exchange unchanged at 1 s. 6 d. was justified. Although

the linking of the rupee with sterling amounted to a depreciation of the rupee in terms of gold to the extent of about 30 per cent, the competitive advantage to Indian exports was offset by the larger depreciation of the currencies of India's competitors, notably Japan, Argentina and Australia. Generally, Indian public opinion favoured a moderate devaluation of the rupee in terms of sterling as an anti-depression measure; the currency controversy was limited mainly to this question of an adjustment in the exchange ratio to 1 s. 4 d. as against maintenance of the *status quo*. The official justification of the existing ratio was based on the ground that India as a debtor country on external account benefited by the *status quo* as devaluation would have necessitated raising of larger amounts in domestic currency to meet the Home Charges of the order of about £30 million due every year to the United Kingdom.

As measured by the relative price levels in India and the U.K., it appears that the rupee was for a time undervalued in terms of sterling. This undervaluation of the rupee in terms of sterling (placed by different authorities within a range of 10 to 31 per cent) meant a rise in the rupee price of gold which therefore was one of the contributory factors to the large-scale export of gold from India estimated at about Rs. 300 crores over the period 1931-37. This reversal of the historical role of India as a habitual net importer of gold could not, however, be wholly or largely attributed to the under valuation of the rupee. The extensive dishoarding of privately held gold reflected the distress sales by agriculturists who were unable to meet their monetary commitments like tax and interest payments, or even to maintain their customary standards of living, due to the fall in agricultural prices. In effect, these gold exports meant a monetization of a sterile asset although some sections of public opinion advanced official purchases to strengthen currency reserves. But in view of the prevailing uncertainty about the future of the international gold standard and the commitment to the sterling exchange standard, currency policy did not reflect a definitive position on gold exports.

The maintenance of a fixed rate of exchange naturally precluded an expansionist monetary policy aimed at stimulation of the economy through finance of public works, etc. Even the creation of the Reserve Bank in 1935 did not make any material difference to this aspect of currency policy as the bank was statutorily committed to buy and sell sterling within the limits of 1 s. 6-3/16 d. and 1. s 5-49/64 d. subject to minimum transaction of £10,000 or its equivalent.

The Reserve Bank was given powers to regulate credit through the bank rate and open market operations, but it did not exercise them to any appreciable extent during its early years because of the general slackness of demand for credit, the comfortable reserves position of banks which could always be supplemented by borrowings from the Imperial Bank of India or from their overseas head office in the case of

**Exchange Banks.** The first official bank rate at  $3\frac{1}{2}$  per cent was announced on July 4, 1935. The rate was subsequently reduced to 3 per cent with effect from November 28, 1935, at which level it remained steady for nearly sixteen years. Open market operations were also of a very modest character and, apart from supporting public borrowing operations and the gilt-edged market, they were used to relieve seasonal stringency in the money market through purchase and sale of Government securities and sterling bills.

Although the Reserve Bank could not exert much influence over the credit situation, judging purely by the magnitude of its advances to banks and open market operations, its capacity to meet seasonal monetary stringency was a distinct improvement over the pre-1935 system when such stringency could be relieved only by borrowing additional currency from Government at high rates of interest.

Monetary policy during the war years (1939-45) was comparatively passive in the face of the huge inflationary increase in money supply originating as a cumulative result of budgetary deficits, military expenditure of the British and the Allied forces in India and the favourable balance of trade. Given the current requirements of war expenditure in rupees, the Reserve Bank had to issue large amounts of rupee currency against sterling and *ad hoc* Treasury bills of the Government of India as provided in its Act. But the mere fact that the additional currency had adequate foreign cover in the form of sterling did not alleviate the inflationary impact of the expansion of money. The war-time inflation reflected the gap between a comparatively inelastic supply of essential goods, a large portion of which was being increasingly appropriated for defence requirements, and the rise in effective demand due to rising employment and incomes. Besides, the decision to finance the war on the basis of cheap and stable money meant relinquishing the use of the interest rate as a weapon of monetary policy though it is doubtful whether the excessive liquidity of the banking system or even of the economy as a whole could have been absorbed merely by stepping up yields on Government securities.

#### IV. Monetary Policy Since Independence

Despite the essential similarity of the basic economic framework for its operation in the two periods, Indian monetary policy since independence presents some significant contrasts to its role in the pre-independence period. The general identity of the economic environment for monetary policy in the period before and after independence lies in the largely unaltered character of the broad structural features of the economy bearing upon the conduct of monetary policy like the considerable extent of the non-monetized sector, the predominance of currency in money supply, the extent of seasonality in currency circulation and credit and the

dichotomy of the organized and unorganized sectors in the money market. However, there has been a considerable change both in respect of the institutional framework of monetary policy and its more active use to influence the tempo and tenor of economic development. Thus, for one thing, there has occurred an enlargement of the scope, effectiveness and range of employment of the instruments of quantitative and qualitative credit control vested in the Reserve Bank under its own Statute as progressively amended as well as in terms of the Banking Companies Act, 1949, and its successive amendments.

In the period immediately after independence, the role of monetary policy continued to be largely subsidiary to sustaining the cheap money policy which was more or less an inheritance of the phase of war finance. Consequently, the bank rate remained constant at 3 per cent and the open market operations of the Reserve Bank which were aimed at a general support of the gilt-edged market resulted in large net purchases from the banking system. The maintenance of a fixed pattern of yields meant monetization of the bank-held Government debt through large-scale purchases by the Reserve Bank. In the context of the ample cash reserve position of commercial banks, it enabled the banking system to be virtually independent of Central bank credit.

It was the inflationary conditions generated in the wake of the Korean War boom in 1951 that led to the emergence of credit control as a purposive instrument of economic policy. To begin with, the bank rate which was unchanged at 3 per cent ever since 1935 was raised to  $3\frac{1}{2}$  per cent in November 1951. In itself this measure would not have been of much consequence considering that in India, in the absence of a developed bill market, the bank rate had not functioned as a rediscount rate. Rather, its customary significance as an advances rate against approved collateral was enhanced by a simultaneous change in open market policy. To make the rise in the bank rate effective, the Reserve Bank also announced that it would not buy Government securities from banks as a matter of course to meet their requirements of seasonal expansion of credit, save in exceptional circumstances, but make advances against the collateral of Government securities. Soon after this a Bill Market Scheme was formulated under which banks could convert advances to their clients into usance bills and borrow against them from the Reserve Bank. This provided a convenient mechanism for controlling the flow of Central bank credit to commercial banks while enabling them to meet their legitimate credit requirements. The scheme was initially subsidized by offering a rate lower by  $\frac{1}{4}$  per cent than that on Government securities. Subsequently, in 1956, this rate was raised in two stages to  $3\frac{1}{4}$  per cent.

But even more than the Korean War boom phase, the commencement of the Second Five Year Plan witnessed the progressively growing im-

portance of monetary policy. The pressure of investment expenditure of the Second Five Year Plan witnessed the progressively growing importance of monetary policy. The pressure of investment expenditure under the Plan led to a gradual upward rise in market rates of interest; the bank rate too was raised to 4 per cent in May 1957. Likewise, the effective rate of borrowing under the Bill Market Scheme was increased to 4.2 per cent with an increase in the stamp duty on usance bills. The introduction, in October 1960, of a system of borrowing quotas for banks under graded lending rates by the bank was yet another landmark in the gradual sophistication of monetary policy. Since then this system has been retained with appropriate variations and modifications in keeping with changing requirements. It is a system which aims to reconcile the obligations of the Reserve Bank as a lender of last resort as well as the controller of credit with its role as promoter, through preferential rates of lending, of special sectors or purposes like agriculture, small-scale industries, co-operatives, exports, etc. Its mechanism consists of fixation of quotas, based on statutory reserves, for borrowing by banks from the Reserve Bank whether against Government securities or under the Bill Market Scheme at graded slab rates, with provision for borrowings above the quota at higher rates; lending for special preferential purposes is charged at the lowest slab rate, viz., the bank rate. Since the need for borrowing by banks is specially acute during the busy season, the increase in the Reserve Bank's average lending rate and ceilings on banks' borrowings help to regulate the expansion of credit. Initially, there were three slabs with quotas fixed for the first two slabs, for which the prescribed rates were the bank rate and one per cent above the bank rate, respectively, whereas there was no limit to borrowing for the third slab at 2 per cent above bank rate. The number of slabs and the rates of interest applicable thereto have changed from time to time. A change of some importance in the system was, however, introduced from November, 1962 when lending above the quotas became restrictive, being subject to a detailed assessment of individual cases by the Reserve Bank. Till September 1964, there were two slabs of lending rates within the quotas, at  $4\frac{1}{2}$  and 6 per cent, respectively and a third slab for special accommodation of a discretionary nature at  $6\frac{1}{2}$  per cent.

Effective September 25, 1964 the slab system of lending rates was replaced by the differential rates scheme and concurrently the Reserve Bank evolved the concept of net liquidity ratio with a view to preventing banks from circumventing the requirements of the statutory liquidity ratio by borrowing against eligible paper. The net liquidity ratio is defined as total of bank's cash balances with the Reserve Bank and other banks in current account and all investments in approved securities less its total borrowing from the Reserve Bank, the State Bank and the Industrial Development Bank of India (I.D.B.I.).

Under the differential rate scheme, as long as the net liquidity ratio was at or above 28 per cent, the Reserve bank's accommodation was made available to banks at the bank rate. For every percentage drop in the ratio, the cost of borrowing on the entire amount moved up by  $\frac{1}{2}$  per cent. In September 1964, the bank rate was raised from  $4\frac{1}{2}$  per cent to 5 per cent. Simultaneously, the Reserve bank fixed the maximum rate of lending for bigger banks at 9 per cent, which was raised to 10 per cent in February 1965, when the bank rate was also stepped up to 6 per cent.

The system as thus envisaged had a self-correcting element in as much as, with every increase in borrowing from the Reserve Bank, the rate at which a bank could make further borrowing rose progressively, while, at the other end, it was constrained by the ceiling rate on its own advances to customers. This, in effect, established the principle of differential rates on borrowings from the Reserve Bank, depending on the individual bank's liquidity position.

Broadly, the system has continued to-date with certain modifications from time to time. Thus, in February 1965, the minimum liquidity ratio required to qualify for bank rate accommodation was raised from 28 per cent to 30 per cent. In November 1965, the rate of escalation for lending was also raised from  $\frac{1}{2}$  per cent to 1 per cent for every drop of 1 percentage point or fraction thereof from the minimum liquidity ratio of 30 per cent. Certain concessions have also been granted from time to time in respect of the net liquidity ratio. Thus, refinance to priority sectors such as food procurement, defence supplies and export packing credit was provided at bank rate irrespective of net liquidity ratio. For the 1966-67 busy season banks were given additional refinance facilities at bank rate for an amount equivalent to 10 per cent of the actual net liquidity ratio as at the end of 1966 slack season. Provision was also made for the Reserve Bank to charge a penal rate of 10 per cent for any borrowings in excess of the borrowings at the bank rate.

In view of the recessionary trends in certain sections of the industry, the Reserve Bank's refinance policy was selectively liberalized since August 1967. Thus a preferential rate of  $4\frac{1}{2}$  per cent was applied for export packing credit for engineering and metallurgical products. With a view to stimulate the economy, concurrently with certain fiscal measures announced in the budget for 1968-69, the Reserve bank also initiated certain monetary measures. The Bank rate was reduced from 6 per cent to 5 per cent in March 1968, and the maximum rate on bank's advances to customers was lowered to 9.5 per cent from 10 per cent.

Since October 1968, a uniform rate of  $4\frac{1}{2}$  per cent was charged, irrespective of the net liquidity ratio for the total short-term advances to agriculture and small-scale industries and not merely the increments over the base periods as before. In February 1970, certain concessions

granted with respect to priority sectors were withdrawn as credit had expanded at a faster rate than warranted by the real trends in the economy. Thus, although changes were made from time to time in the differential rate system of lending based on the net liquidity ratio, the basic element of this policy, namely, the application of a penal rate in the event of a fall in the liquidity ratio below 30 per cent, continued to be in operation.

The fact that banks have had frequent resort to borrowings from the Reserve Bank against Government securities and under the Bill Market Scheme is a significant index of the effectiveness of the bank rate-cum-borrowing quota technique of Central banking in India.

TABLE IV  
Reserve Bank Credit to Scheduled Banks

(In crores of Rs.)

| <i>Outstanding as on last Friday of March</i> | <i>Against usance bills and/or promissory notes</i> | <i>Other Advances</i> | <i>Total</i> |
|-----------------------------------------------|-----------------------------------------------------|-----------------------|--------------|
| 1951                                          | —                                                   | 12                    | 12           |
| 1956                                          | 29                                                  | 35                    | 64           |
| 1961                                          | 45                                                  | 50                    | 95           |
| 1966                                          | 53                                                  | 23                    | 76           |
| 1970                                          | 78                                                  | 160                   | 238          |

However, the effectiveness of the bank rate technique is still limited by the lack of integration and cohesion in the money market. Similarly, the use of open market operations has been subject to varying limitations since the inception of the bank. In the early years the statutory restrictions on the volume and maturity of rupee securities which the bank could hold in its portfolio as well as the comparatively under-developed state of the security market inhibited recourse to open market operations. The pursuit of cheap money in the war and post-war years necessitated virtually unlimited purchase of securities from the banking system. It was only when 'cheap money' was replaced by 'regulated money' following the rise in the bank rate in 1951 that it was possible to regard open market operations, as observed above, as a purposive instrument of policy through the extension of discriminating support to the gilt-edged market. This was reflected in the emergence of moderate net sales in contrast to net purchases in the earlier years. Open market operations have been used increasingly as an adjunct to Government borrowing operations, primarily in the maintenance of orderly conditions in the gilt-edged market rather than to influence the cost or availability of credit. However, their use for meeting the seasonal need of banks for reserves illustrates their potential significance in the Indian context as a flexible instrument to regulate the monetary climate.

TABLE V  
Open Market Operations of the Reserve Bank of India

| <i>Financial Years</i> | <i>(In crores of Rs.)</i> |                      |
|------------------------|---------------------------|----------------------|
|                        | <i>Net Purchases (—)</i>  | <i>Net Sales (+)</i> |
| 1945 to 1951           | —                         | 281.06               |
| 1951 to 1956           | +                         | 55.47                |
| 1956 to 1961           | +                         | 72.26                |
| 1961 to 1966           | +                         | 55.43                |
| 1966 to 1970           | +                         | 218.93               |

Although there is at present no statutory restriction on either the volume or maturity of Government securities which can be held by the Reserve Bank in its portfolio, in practice open market operations have been confined to medium and long-dated securities in the absence of a developed market for Treasury bills.

The inherent limitations of the bank rate and open market operations as instruments of monetary policy in India underline the importance of other weapons, notably the variation of reserve requirements, selective credit controls and moral suasion. The power to vary the statutory reserve, and hence the cash base of commercial banks, is peculiarly suited to Central banks in under-developed money markets where the classical weapons of bank rate and open market operations have comparatively less scope. It was not until October 1956 that the Reserve Bank acquired the necessary powers to vary (a) the reserve ratios of banks between 5 and 20 per cent of demand liabilities and 2 and 8 per cent of time liabilities and (b) the proportion to be maintained as reserves of the increase in deposits after a certain date upto 100 per cent of the increase in deposits subject to the aforesaid overall maximum. It was, however, not until March 1960, that the Reserve Bank had occasion to employ these new powers when banks were called upon to maintain with the bank 25 per cent of the increase in deposit liabilities over and above the minimum statutory reserves. The requirement was raised to 50 per cent of the additions to deposit liabilities after that date. The impounded deposits were subsequently released in two instalments (March 1960 and January 1961) as part of the changed credit policy of the bank consequent upon the introduction of the three tiers of lending rates. As from September 1962, the minimum statutory reserve requirements were unified at 3 per cent for both demand and time liabilities taken together and made variable upto 15 per cent. The merger of the differential ratios for demand and time deposits is indicative of the growth in volume of time deposits and even more of the fact that, in practice, these deposits tend to have a maturity shorter than their formal period of deposit.

But the distinctive feature of Indian monetary policy has been the extensive resort since 1956 to qualitative controls, as distinct from the

foregoing quantitative weapons, notably the flexible use of selective holding of commodities in short supply or else to restrain excessive borrowing from banks in the form of clean advances (*i.e.*, without formal security or collateral) or against the security of assets such as stocks and shares. These selective credit controls have mainly taken the form of stipulation of margin requirements and directives to maintain aggregate credit against particular commodities (mostly foodgrains, oil-seeds, sugar, cotton and jute) within specified limits. The implementation of these controls has its problems in a banking system with a very wide branch network and regional diversities. But, on the whole, there has been responsive co-operation on the part of the banks and selective controls have played a salutary role in maintaining orderly conditions in commodity markets.

Formal credit controls, whether quantitative or qualitative, have often been supplemented by recourse to moral suasion through informal consultation with and exhortation of the banking community by the Governor of the Reserve Bank. This technique has a certain efficacy in view of the concentration of the major part of the resources of the banking system in a comparatively small number of banks but it also has its limits. It has worked particularly well where the climate for its use with regard to the interests of the banking system is propitious.

In retrospect it may be said that the period since independence has, on the whole, been notable for the gradual emergence of an articulate and flexible monetary policy aimed at reconciling the requirements of an expanding volume of money to finance the expansion of output while restraining the use of credit for unproductive and non-essential purposes. While the onus of maintaining general economic stability does not rest exclusively or even largely on monetary policy, it can be said with some justification that monetary policy has been operated with a view to ensuring a reasonable degree of stability consistent with the needs of economic development.

#### V. External Value of the Rupee

The preceding paragraphs have dealt with the evolution of the rupee primarily in the context of internal economic developments. But the role and significance of a currency unit is no less important in terms of its use in international transactions; in this context, it is the external value of the currency, *i.e.*, its relation with other currencies, that is of interest. As indicated earlier, for many decades the internal aspects of currency policy in India were largely subordinated to its external aspects. This was a logical corollary to the statutory link of the rupee with sterling. During the heyday of the

international gold standard, the rupee was, through its link with sterling, on a gold exchange standard. With the realization of the importance of internal monetary management and a rejection of the automaticity implied in the gold standard arrangements, there was virtually a world-wide abandonment of the gold standard. In September 1931, the movement was sparked when the U.K. went off the gold standard. For India, however, the gold exchange standard was replaced by a sterling exchange standard which continued to detract from the full freedom of monetary management. Thus, the rupee sterling rate set, as mentioned earlier, after much controversy at 1 s. 6 d. per rupee in April 1927 (in terms of the Currency Act) remained unchanged through the maelstrom into which currencies were thrown following the Great Depression of 1929-31 and was the ratio that was also formally adopted in the Reserve Bank legislation (Sections 40 and 41). This rate continued to be in force until June 6, 1966, when the rupee was devalued in terms of all currencies including the sterling.

Meanwhile, however, a major change has occurred in the theoretical and legal basis of the ratio in the wake of independence as well as India's membership of the International Monetary Fund (I.M.F.). The par value of the rupee is now set in terms of gold as required by the I.M.F. Articles of Agreement. The Reserve Bank of India Act was accordingly amended in 1947 without specifying any particular rate of exchange but making it subject to determination by the Central Government having regard to its obligations to the I.M.F. On India joining the I.M.F., the rate was initially fixed at 4.145 grains of fine gold per rupee corresponding to the 1 s. 6 d. rate to sterling. When the pound sterling was devalued by 30.5 per cent in September 1949, the rupee, like the currency of most sterling area members, was also devalued to a similar extent and the par value was fixed at 2.880 grains of fine gold per rupee. Thus, while in terms of gold the rupee was devalued from Rs. 3.31 to Rs. 4.76 per dollar, the rupee-sterling ratio was unchanged at 1 s. 6 d.

The rupee was again devalued by 36.5 per cent on June 6, 1966, so as to bring domestic prices into alignment with external prices. In terms of the U.S. dollar, the rupee was devalued from Rs. 4.76 per dollar to Rs. 7.50 per dollar. The new par value of rupee works out to 1.828 grains of fine gold as against 2.880 grains of fine gold heretofore. The value of the rupee in terms of sterling was also accordingly changed from 1 s. 6 d. to 11-3/7 d. Unlike the previous devaluation in 1949, which was only in terms of non-sterling currencies, the devaluation in 1966 was in terms of all currencies.

Though the rupee is now formally linked to gold in terms of the I.M.F. Articles, in practice, the link with sterling continues to be important for historical reasons as also because the larger portion of India's external transactions has been and is financed in sterling. The major portion of

India's reserves is maintained in London. India is a member of the Sterling Area group of countries, which involves a pooling of exchange reserves of the members in London and the financing of the bulk of their foreign trade in sterling; further, while each country has the right to determine its rate of exchange, the exchange parity is maintained through operations in spot and forward sterling.

The considerations which guide a country in the choice of an appropriate par value are, briefly, that it should enable the currency unit to perform adequately its functions as a medium of international payments, viz., financing the stream of imports of goods and services needed by the economy through an adequate flow of exports, visible and invisible. This would have to take into account the pattern of relative costs, incomes and prices between the country and the outside world and, more particularly, the pattern and structure of its external trade. Obviously, no country can afford to support an exchange rate which is clearly out of alignment with international costs, incomes and prices and which makes it difficult to achieve external equilibrium over time. Implicit in the above is the assumption that a country's demand for and supply of foreign exchange would be decided by the free play of market forces. In practice, however, official intervention in the market process is widespread whether by tariffs, subsidies or import and other controls and it is, therefore, difficult to assert that any particular rate is the appropriate one for maintaining equilibrium, allowing for short-term variations, in the exchange market. Further, the experience of the nineteen thirties showed that countries, in their pursuit of policies designed to adjust their internal economies free from the constraints of exchange rate rigidities in automatic standards, often allowed exchange rate variations to be used as a protective device. This was a period of competitive exchange depreciation and international currency disorder. The I.M.F., set up after the war, with India as a founder member, seeks to bring about order in international monetary affairs and, for this purpose, aims at preventing unilateral actions like competitive exchange depreciation. The objectives of the Fund are not only to bring about stable exchange rates but fixed rates (as against floating rates) and also unitary exchange rates (as against multiple rates). The rupee rate is in conformity with these objectives. The Fund arrangements, however, by no means imply a reversion to the rigidities in exchange rate structure of earlier monetary standards. In fact, while its Articles provide for the liberalization of trade and payments, they also provide for a change in a country's exchange rate in consultation with the Fund to correct fundamental disequilibrium.

In terms of the Fund agreement, member countries have to maintain the par value within limits of 1 per cent on either side of parity. In keeping with the sterling area practice, in India this takes the form of the

Reserve Bank's readiness to buy and sell spot and forward sterling within narrow limits. The bank buys both spot and forward sterling (upto 6 months) from authorized dealers (scheduled banks authorized to deal in foreign exchange) at 1 s. 6 d. per rupee. The selling rate for spot sterling is 1 s. 5-63/64 d., the rate for forward sterling being slightly lower at 1 s. 5-31/32 d. After devaluation, the buying rate for delivery within six months was changed to £4.7619 per Rs. 100 and the selling rate for ready delivery to £4.7467 per Rs. 100. Forward sales by the Reserve Bank of India were discontinued from June 10, 1966. Following the change in the per value of the pound sterling on November 18, 1967, the actual rates at which the Reserve Bank of India bought and sold sterling were also revised. The buying rate for delivery within six months (including spot) was changed to £5.556 per Rs. 100 and the selling rate for ready delivery to £5.538 per Rs. 100.

The narrow spread between the Reserve Bank's buying and selling rates for spot sterling and its provision of forward cover affords a convenient arrangement for authorized dealers to convert rupees into sterling and *vice versa* and helps them in turn to meet the requirements of the public at fine rates thereby ensuring that the rupee-sterling rates move well within the terms set by the Fund Agreement. This has also enabled the authorized dealers to buy sterling at rates fixed by the Foreign Exchange Dealers Association (comprising the banks authorized to deal in foreign exchange); these rates are fixed in consultation with the Reserve Bank. Exchange rates in India for non-sterling currencies are governed by the prevailing rates in the London Exchange market for those currencies *vis-a-vis* sterling.

One of the primary objectives of the I.M.F. is to free international payments on current account from control and to assure full convertibility for currencies earned in current transaction. The Fund's Articles recognize that restrictions on capital transfers would be necessary, but they also provide for the transitional provisions (Article XIV) whereby countries can maintain restrictions even on current transactions. While the primary purpose of this Article was to enable countries to adjust their economies during the post-war transition, its provisions have also been helpful to countries like India experiencing balance of payments difficulties during a period of growth. In terms of the Fund Agreement (Article XIV), countries are required to consult with the Fund each year on the nature and extent of exchange restrictions and the progress achieved in regard to removing discriminatory restrictions.

While the exchange restrictions now in force in India are thus permitted by the I.M.F., the restrictions themselves date back to the outbreak of World War II in 1939 when exchange control was introduced under the Defence of India Rules both as an instrument of economic warfare and to conserve and restrict the use of scarce foreign (non-

sterling) currencies for essential purposes.

In the post-war years with large deficits in India's balance of payments, it has been necessary to extend the war-time exchange controls on a permanent basis. Accordingly, the Foreign Exchange Regulation Act of 1947 was enacted in terms of which the Government and the Reserve Bank of India are empowered to control all transactions involving foreign exchange, including foreign securities and, among other things, prohibit dealings in foreign exchange by other than authorized dealers at rates other than those fixed by the Reserve Bank. This Act is administered by the Reserve Bank in accordance with the general policy laid down by the Government in consultation with it. With the general shortage of foreign exchange, including sterling, it became necessary to extend in 1947 the control to sterling area countries also. With mounting imports under the successive plans for economic development, it remains necessary to ration foreign exchange so as to distribute current earnings of foreign exchange among competing demands so as to be of the maximum advantage to the nation.

## B. PRICES

This section presents a historical review of the broad movements of prices in India since the middle of 19th century, their more important causal factors and economic consequences. Apart from the limitations imposed by the difficulty of constructing accurate price indices, the absence of adequate and consistent time series of price data precludes meaningful comparisons of prices over a long period of time. The emphasis is, therefore, on the more salient aspects of price fluctuations.

The history of prices in India may be conveniently divided into six well-marked phases, namely:

- (a) 1860s until early 1890s;
- (b) 1890s until World War I;
- (c) World War I and early post-war period (1915-20);
- (d) Inter-war period (1920-1939);
- (e) World War II, post-war transitional period and post-independence period (1939-1951), and
- (f) The period of planned economic development (1951 onward).

(a) 1860-1893: The 1860's are a convenient starting point. Not only does the earliest available general index relate to 1861 but the three decades following are also roughly the period when the Indian economy and its domestic price and income structure, which had hitherto been comparatively insulated, were increasingly exposed to external influences. The earlier part of this period was marked by cyclical movements with

phases of rising prices alternating with those of price declines. This was especially so until 1880; the Indian price level was influenced not only by domestic and natural causes such as the vagaries of the monsoons but by external factors such as the American Civil War, the opening of the Suez canal and fluctuations in world prices of the precious metals.

TABLE VI  
Weighted Index Number (100 Articles)

| Base: 1873 = 100 |     |      |     |
|------------------|-----|------|-----|
| Year             |     | Year |     |
| 1861             | 93  | 1880 | 109 |
| 1865             | 109 | 1885 | 116 |
| 1870             | 107 | 1890 | 117 |
| 1875             | 96  | 1893 | 129 |

The initial phase (1861-66) witnessed a steep rise in Indian prices. The American Civil War and the consequent diversion of demand for cotton to exports of this commodity from India set off a boom in cotton prices in India which led to a large influx of precious metals to the country and a considerable volume of silver coinage. A general rise in the price level was the result, the index increasing by over 17 per cent to 109 in the 4 years upto 1865. A down-trend in world prices followed the end of the Civil War in the States and the expansion in world trade (helped also by a fall in the freight rates). Between 1865 and 1875 prices receded by 12 per cent, the index falling to 96. But for a brief spell between 1876-79, when prices rose by about 34 per cent, almost exclusively in respect of food articles following famine conditions over vast areas in India, prices on the whole continued their decline until the early 1880s. While the fall in Indian prices was to a large extent the counterpart of a world-wide trend, the downward movement in India was halted earlier than abroad as a result of a fall in the value of the rupee; the depreciation of the rupee was associated with a sharp fall in the price of silver following a large increase in its production. The fall in the value of silver had commenced even in the mid-seventies but after 1883 the rate of depreciation in the value of silver was accelerated. By 1893 the price index had risen once again to 129.

(b) 1893-1914: The closure of the mints in India after 1893 following the Report of Herschell Committee, referred to in an earlier section, brought in another interlude of decline in prices till about 1899 when the index touched 121; the exchange rate was stabilized at 1 s. 4 d. per rupee in that year.

TABLE VII  
Weighted Index Number (110 Articles)

| Base: 1873 = 100 |     |      |     |
|------------------|-----|------|-----|
| 1893             | 129 | 1910 | 150 |
| 1899             | 121 | 1914 | 187 |
| 1900             | 143 |      |     |
| 1905             | 135 |      |     |

From about the turn of the century until the outbreak of World War I, prices were once again generally on the increase and especially so after 1905. The position was considered sufficiently serious to warrant the appointment by the Government of India in 1910 of the Prices Enquiry Committee under the chairmanship of K. L. Datta to examine the causes for the price rise in India. The committee noted that prices in India during the quinquennium 1907-11 were 40 per cent higher than in 1894-98. This rate of increase, the committee pointed out, was higher than in several countries including the U.K. and the U.S.A. where the price increase was 21 per cent and 38 per cent, respectively. The rise in Indian prices was over a wide commodity range and covered both export staples and consumer goods. Foodgrain prices rose by 30 per cent, raw cotton and jute by 58 per cent, metals by 22 per cent. The committee cited both internal and external factors as being responsible for the rise in the price level. The rise in world prices during this period due mainly to the wider use of gold as monetary metal and the pressure of demand arising from military expenditure in several countries was communicated to India through the fixed exchange rate. Internally, although production was increasing, it was not large enough to match the rising demand due to expansion of population and the increasing purchasing power. The excessive coinage of rupees inconvertible into gold was a major factor making for higher prices. Thus, the volume of currency rose between 1898-1913 by nearly 99 per cent and prices by 58 per cent.

(c) **World War I and Early Post-War Period (1914-1920):** With the outbreak of World War I the pace of price increase accelerated sharply. In the initial period of the war, however, the rise in prices in India was slower than in the belligerent countries due to war-time restrictions on export of goods and import of the precious metals. The rise in the domestic price of silver and the fixed rupee sterling exchange rate were once again the principal factors in bringing about the steep rise in prices. The expansion of money circulation was particularly sharp after 1917; by 1920, the Calcutta Index of prices had risen by over 100 per cent compared to the level of 1914.

(d) **The Inter-War Period (1920-39):** While the purchasing power of the rupee was thus declining internally, its external value was, however, rising as sterling depreciated at a faster rate; consequently, at the end of 1919 and early in 1920, the rupee value was about 2s. 4d. The adoption of the 2s. rate for the rupee in accordance with the Babington-Smith Committee's recommendations and the deflationary currency policy following the maintenance of rigid exchange ratio were super-imposed on the post-war decline of prices abroad which was communicated to India. By 1929, Indian prices had moved down by nearly 30 per cent.

compared to 1920. With the onset of the Great Depression (1929-32), Indian prices declined further sharply and by 1932 prices had dropped by another 35 per cent; this was a rate of decline much more severe than in many other countries.

TABLE VIII  
Index of Wholesale Prices (1929=100)

| <i>Average for<br/>the year</i> | <i>India<br/>(Calcutta)</i> | <i>United<br/>Kingdom</i> | <i>U.S.A.</i> | <i>Australia</i> |
|---------------------------------|-----------------------------|---------------------------|---------------|------------------|
| 1930                            | 82.3                        | 87.5                      | 90.7          | 88.4             |
| 1931                            | 68.0                        | 77.0                      | 77.0          | 79.2             |
| 1932                            | 64.5                        | 74.9                      | 68.0          | 78.3             |
| 1934                            | 63.1                        | 77.1                      | 78.7          | 81.6             |
| 1936                            | 64.5                        | 82.7                      | 84.8          | 85.6             |
| 1937                            | 72.3                        | 95.2                      | 90.6          | 91.9             |
| 1938                            | 67.6                        | 88.8                      | 82.5          | 92.2             |

External influences were aggravated by an orthodox exchange policy; nor was domestic monetary and fiscal policy geared for reviving economic activity. India also felt the adverse impact of a worsening of the terms of trade; agricultural commodities (which constituted the bulk of her exports) suffered larger price declines than did industrial products (her major imports).

The trough of the Depression had been reached in 1932 and from then on there was a steady recovery in prices with the revival of production and trade. The rearmament programmes in several countries abroad provided a further stimulus. By 1937, the Calcutta index had risen by 12 per cent compared to 1932. The middle of 1937 witnessed a recession once again in business activity in the United States and other countries; though this recession proved short-lived, Indian prices continued to decline and, by 1938, the index (base: 1929 = 100) had once again dropped to 68 around which point it hovered until the summer of 1939.

(e) **World War II and Early Post-war and Post-Independence period (1939-1951):** The outbreak of the Second World War in September, 1939 marked the commencement of yet another phase of price increase. With the progressive mobilization of resources for the war, prices tended to rise; the super-imposition of high and rising demand on a relatively inelastic supply of essential goods and the diversion of commodities from civil to military uses exerted a steady pressure on wholesale prices and the cost of living. Especially after 1941, with India becoming a base of operations and the larger expenditure incurred here on behalf of Allied forces and with the use of inflationary methods to finance war expenditure, the general price level took a sharp upturn, despite the imposition of rationing and of price controls on a wide range of commodities. Over the war period as a whole, the general price level rose by 143 per

cent, the increase being more pronounced in the case of food articles, export commodities and agricultural products in general.

| Average 1942                            | 144.2         | 130.5            | 116.8                          | 162.4         | 162.5                 | 138.7                    |
| " 1943                                  | 213.5         | 247.8            | 215.3                          | 172.0         | 227.0                 | 210.4                    |
| August 1945                             | 244.1         | 239.4            | 268.0                          | 210.8         | 243.5                 | 248.4                    |
| %variation August 1945 over August 1939 | 143.4         | 138.7            | 166.1                          | 110.4         | 143.5                 | 195.8                    |

This order of increase in the general index was, however, much below the rate of monetary expansion; this was partly due to the price controls which made the inflation 'latent' rather than 'open'. This monetary expansion was, indeed, backed by sterling assets but this afforded no relief from inflationary pressures as these foreign assets could not be transformed into real resources by enlarging the import of commodities owing to war-time shortages of shipping space, diversion of resources to defence uses and the loss of Burmese rice following the Japanese occupation of Burma.

Note: Data on money supply relate to last Friday of March. Data on wholesale prices and working class cost of living relate to financial year averages with 1939 relating to 1939-40 and so on.

\*Base August 1939=100.

The cessation of the war did not alleviate the price situation. The continuance of heavy governmental expenditure and the maintenance of cheap money led to the persistence of inflationary conditions which was aggravated by crop failures. Between September 1945 and August 1947 wholesale prices rose by over 20 per cent and the cost of living index (Bombay) by 18 per cent. The dismantling of war-time controls over several essential consumer goods as well as the upward revision of controlled prices in respect of others apparently aggravated a basically untenable price situation through activating the latent inflation.

The economic consequences of country's partition accentuated the pressure on prices; the Indian Union became a net importer of foodgrains, jute and cotton. The increase in expenditure on defence and rehabilitation and the experiment of food decontrol (between November 1947 and July 1948) further pushed up prices; from August 1947 to July 1948 prices increased by 29.3 per cent. There was a temporary recession in prices in the second half of 1948 and the early part of 1949 though the decline only partly offset the increase that occurred during the phase of decontrol. With the devaluation of the rupee, along with sterling in September 1949, prices again started to rise, the outbreak of the Korean War in 1950 providing a further powerful stimulus to this trend. Once again, the rise in commodity prices all over the world was communicated to India, though the degree of price increase here was somewhat less. The peak was reached in April 1951 when the index of wholesale prices touched 462.0 — a rise of 16.3 per cent compared to the pre-Korean War level and of 18.8 per cent compared to the pre-devaluation level. Food articles and industrial raw materials prices in particular rose to inordinately high levels.

At the commencement of the First Plan, the Indian price level was thus 55.7 per cent higher than at the time of independence, and 90.6 per cent higher than at the end of World War II.

**(f) Period Of Planned Economic Development (1951-1969):** Given the objective of development with stability, price policy in a planned economy has to ensure that absolute and relative movements of prices accord with Plan priorities. In particular, given the pattern of consumption, it is necessary to avoid any excessive increase in the prices of essential items of consumption, in particular, of foodgrains. The role of price policy is crucial in that stepping up the rate of development inevitably sets in train pressure on prices. The behaviour of prices in the First and Second Plans must, therefore, be viewed against this perspective.

As mentioned above, the price level in India at the commencement of the First Plan represented the peak of the post-Korean price increase. With the collapse of the post-Korean commodity boom as well as with the implementation internally of corrective fiscal and monetary policies,

prices fell sharply in the early months of 1952. The decline in Indian prices in this period was sharper than in several countries abroad, and by March 1952, the wholesale index had moved down by 18.5 per cent from the April 1951 level. After remaining generally steady around this level for about two years, prices fell sharply in 1954-55 following the bumper harvests of 1953 and 1954. Between March 1953 and March 1955 the overall index declined by 8 per cent and food prices in particular fell by about 19 per cent necessitating price support operations by Government. Whereas the decline in prices in 1952 was partly the result of a contractionist monetary policy, the decline in 1954-55 occurred at a time when money supply increased and indicated that the expansion of aggregate monetary demand was not sufficient to absorb the increase in overall supplies, especially of the agricultural commodities. By July 1955, the decline was arrested and in fact reversed, marking the recommencement of a phase of price rise, and over the whole of the last year of the First Plan prices increased by 18 per cent. The level in 1956 was, however, still 22 per cent below that at the beginning of the Plan. The all India cost of living index (1949 = 100) also varied considerably over the period of the First Plan but at the end was only 3 per cent below that at its beginning (Table XI).

The Second Five Year Plan thus started, as did the First Plan, against the background of rising prices; unlike the earlier period, the primary impetus to the rise in prices in 1956 was internal. Lower agricultural output, combined with rising investment expenditures, reflected in a sharp monetary expansion in the last year of the First Plan, exerted pressure on prices and policy was accordingly geared to bring about relief from a situation of rising prices, especially of foodgrains; imports of grains were stepped up and selective credit controls on foodgrains advances were initiated. Prices were on the whole steadily rising over the whole of the Second Plan and by March 1961 the general index of wholesale prices was higher by 30 per cent compared to the level at the beginning of the Plan. The price increase was shared by all the major groups. Food articles (+27 per cent) and manufactures (+26 per cent) rose by somewhat below the average but industrial raw materials (+45 per cent) showed a much sharper rise. Reflecting the trends in the general wholesale price index, the all-India cost of living index increased by 24 per cent over the Second Plan.

The underlying factor behind the Second Plan price experience had been the rising pressure of aggregate monetary demand as reflected in the sharp monetary expansion, which was nearly three-and-a-half times that recorded in the First Plan. The impact of the rising investment expenditure, reflected in a steep increase in the level of Government indebtedness to the banking system, was moderated initially by a draft on external reserves but subsequently exerted considerable stress on the domestic

TABLE XI

| 5. Manufactures                            | 118.7           | 102.9 | 129.4 | 157.3 | - 13.3               | + 25.7               | + 21.5               |
| 6. All Commodities                         | 120.2           | 98.1  | 127.5 | 172.3 | - 18.4               | + 30.0               | + 35.1               |

price situation. The expansion of demand coincided with shortfalls in agricultural production, especially of foodgrains, particularly in 1957-58. The situation was alleviated by larger import of foodgrains, the bulk of it under P.L. 480 agreements. Towards the end of the Plan, with a spurt in agricultural production, an element of relative stability was imparted to foodgrains prices, and with their weight in the overall index, to the general price level.

This element of relative stability marked the price experience of the first two years of the Third Plan. With the bumper harvests of 1960-61 and 1961-62, and the continued availability of supplies of P.L. 480 foodgrains, an acceleration of the investment level was possible without any untoward effects on prices. The Chinese aggression in late 1962 and the super-imposition of larger defence expenditure on growing development outlays exerted strong demand pressures in 1963-64. The increase in aggregate demand coincided with comparative stagnation of agricultural production so far during the Third Plan. Over the greater part of 1963-64, prices were consequently on the uptrend and recorded the highest rate of rise during any year in the Third Plan period. Over the Third Plan period, prices rose by 35 per cent on top of a rise of 30 per cent during the Second Plan period. The largest rise during the Third Plan took place under the Food Articles group (47.1%), followed by Fuel and Power (30.3%) and Industrial Raw Materials (30.1%). Manufactures rose by 21.5 per cent and Liquor and Tobacco by 13.5 per cent. Reflecting these trends in the wholesale prices, cost of living also rose by about 40 per cent. Measures to arrest prices, especially of essential commodities, so as to protect the more vulnerable section of the people have included the continuance and, where indicated, the tightening of credit controls, both general and selective, and steps to enlarge the availability of essential goods.

A noteworthy feature of the record of Indian prices in the period of planned economic development as a whole is that they have not risen more than have prices in other countries similarly situated.

Admittedly, it is difficult to generalize about the effects of price changes on the Indian economy over the period of an entire century from 1861 to 1961. Historically, periods of rising prices seem to have been more frequent and prolonged than those of depression and falling prices. For a country like India, with the large mass of the people being net debtors, a gradual rise in prices should in part alleviate the burden of debt. Given the structure of production and marketing, however, only a small proportion of the benefit of higher prices accrues to the agriculturist or artisan owing to interception by middlemen and money-lenders. Likewise, the extent of stimulus to output as a result of high prices is limited by structural and institutional constraints, such as the shortage of capital, skills and enterprise and the largely self-sufficient

character of Indian agriculture. On the other hand, although the proportion of fixed income groups (salary and wage-earners) in the total population is comparatively negligible, the effects of rising prices on general consumption standards are usually serious enough for fixed income groups, including the large class of landless agricultural labourers who are remunerated in cash, to warrant special measures. Also, the bulk of the population, although nominally self-employed, has such small and fluctuating money incomes that its capacity to bear price changes is very limited. Thus, apart from acute famines like those of the nineteenth century and the Bengal famine of World War II, even minor increases in prices, particularly of food articles, impinge harshly on the more vulnerable sections of the community like the salaried middle class, landless and certain other classes of labour and the smaller cultivators and artisans. In the result, the structure of the Indian economy makes it basically more sensitive to the less desirable socio-economic consequences of rising prices.

With the rising tempo of investment expenditure in the phase of intensive economic development ahead, continued pressure on prices is only to be expected. The task of price policy, and indeed of economic policy, in the coming years will be to organize the financing of defence, development and rehabilitation with the minimum disturbance to financial and price stability so as to ensure substantial growth on a sound and orderly basis. Withal, cyclical, temporal and seasonal variations in agricultural prices have to be progressively reduced so as to conform to their economic function of orderly marketing and distribution of supplies. The objective of policy in respect of non-agricultural as of agricultural prices remains to assure a reasonable return to the producer and to safeguard his incentive to sustain a steady flow of output and supplies at a level of prices which, all the same, is fair to the average consumer and to the industrial user of commodities and products.

## CHAPTER XIII

### PUBLIC FINANCE

#### I. Evolution of Indian Public Finance

The finances during the East India Company's regime were characterized by excessive centralization which resulted in provincial extravagance and negligence of local officers. The Provincial Government resented the interference of the Central authority, whose control could not be effective due to the absence of modern methods of accounting and auditing and of rapid means of communication made worse, in the earlier years, by the separation of the Company's territorial areas by independent territories. During the Company's regime, the condition of Indian finance was one of "chronic deficits". Since 1813, when the commercial accounts of the Company were separated from its territorial revenue and expenditure, and until the end of its rule in 1858, there was a surplus of £8.9 million in 13 years of surplus as against deficit in 33 years amounting to £72.2 million. The Company was ceaselessly engaged in aggressive wars which continuously swelled its military expenditure. The expenditure on civil administration was high owing to the exclusion of Indians from higher appointments and it increased with the expansion of the Company's territory. Till 1813, there was also the strain of expenditure on the Company's investment estimated at nearly £1.2 million annually. A certain proportion of the revenue of Bengal had been for many years set apart in the purchase of goods for export to England, and this was called the investment. The Company's expenditure rose from £6.9 million in 1792-93 to £41.1 million in the last year of its rule. The entire revenues were raised in India but a substantial proportion of them were spent in England -- this duality of spending authority was not conducive to efficient expenditure control. No attempt was made to check the growth of expenditure, except the notable decrease from £24.2 million in 1828 to £16.7 million in 1835 as a result of the efforts of Lord Bentinck.

The most important source of income was land revenue. The other sources of revenue, in order of importance, being the opium monopoly, salt revenues, customs (the duties never exceeded 10 per cent), *abkari* or excise and stamps. The Company never cared to develop the resources of the country or to provide nation-building, social and development services, though a beginning was made in these directions.

## II. Indian Finance Under The Crown

At the outset, the entire revenues of the country were pooled into a single Central fund, from which the Government of India met its own expenditure as also that of the provincial Governments. Most of the revenue was collected by the provinces, which were also responsible for disbursing a large proportion of it. As increased revenues or economy in expenditure brought no local advantage, the system was not conducive to efficient management of finances. This extreme centralization led to constant disputes as the provinces had to obtain the approval of the Central Government even for minor items of expenditure. They were more impressed by their own needs and could not appreciate the financial difficulties of the Central Government, which was also not familiar with local problems and was unable to stop provincial extravagance. To remove these defects Lord Mayo, by his Resolution of December 14, 1870, introduced the system of making fixed grants to the provinces for meeting the cost of provincial services, and any extra expenditure on these was to be met by effecting economy or imposing local taxes. A lump sum grant of £4.7 million a year, in addition to the departmental receipts from these services, was made for the provincial services on jails, registration, police, education, medical, printing, roads, civil buildings and miscellaneous public improvements. In the Central accounts, these were replaced by the single item, "Provincial Services". The provinces were given some freedom to appropriate this grant within the several heads and any unspent grant could be carried forward. However, as the need for a strong Central Government was paramount, a number of restrictions were continued to enable the Government of India to retain its controlling and supervisory powers.

The next step forward was taken in 1877, under Lord Lytton, when all the remaining services (along with the connected receipts) except those directly administered by the Government of India, were transferred to the provinces. To meet the extra expenditure, the provinces were given a share of revenue (from excise, stamps and some other items that varied from province to province), which suffered from neglect due to absence of any provincial interest in their collection. If the actual revenue from these heads differed from the estimated realization, the provinces were to share the excess or deficit with the Government of India in equal proportion. Thus, for the first time, the provinces were given a direct interest in the collection of revenue. These contracts were different for different provinces and were subject to revision after five years. When they were revised in 1882, Lord Mayo's lump sum grants were abolished and the provinces were assigned, besides the departmental receipts, a specified share from the revenue heads already transferred to them and a fixed share of land revenue to make up the deficit in their

budgets. When these quinquennial settlements were revised in 1904, an attempt was made to give the same share of the chief sources of revenue to the provinces so as to achieve equality of treatment and the revenue from excise, stamps, income tax, registration, forests, larger irrigation works and land revenue was shared generally in equal proportion between the two Governments. The shares of the "divided heads" were not always the same for all provinces. For example, while the United Provinces received three-eighths of land revenue, Bengal's share was one-half. This resulted in deficits or surpluses in provincial budgets which were adjusted through fixed cash assignments from the central or provincial share of land revenue to the other Government. The provinces also received the departmental receipts, registration fees and minor irrigation receipts and were responsible for expenditure on these heads. The charges on the "divided heads" were shared equally between the two Governments except that expenditure in connection with land revenue, including district administration, was a provincial liability.

The periodical revision of the contracts caused resentment amongst the provinces as the Government of India would try to appropriate to itself most of the improvement in provincial finances. It was not conducive to continuity of financial policy and encouraged hasty and extravagant expenditure by the provinces in the last year of the contracts. The expenditure on Home Charges, incurred in England, caused uncertainty due to a falling exchange rate since the process of decentralization began and imposed a heavy strain on Central finances. By now, the Central budget was no longer a gamble in foreign exchange. Accordingly, the settlements made in 1904 were declared quasi-permanent. After a few changes (such as a larger share of excise revenue to the provinces by reducing the fixed cash assignments from land revenue) the settlements made after 1911 were declared permanent. However, the Government of India was to assist a province in case of widespread famine and call for aid from the provinces in case of war or serious financial crisis.

The history of financial decentralization shows that this process evolved and progressed on considerations of administrative convenience rather than any regard to the principles of finance appropriate to a vast country having wide regional disparities. The arrangements involved gross inequalities between the provinces *inter se* as no regard was paid to the wealth, population, per capita income or need of the provinces in allocating funds to them. Against this must be said that the Government of India was not proceeding on a clean slate and the satisfactory available basis was the actual level of expenditure attained in each province though, to achieve a semblance of equity, subsequent revisions always favoured the weaker provinces. The aim of these steps towards

decentralization was to achieve economy in expenditure and efficiency in revenue collection and they were justified by these tests. The arrangements were occasionally disturbed in emergencies when the provinces were asked to make special contributions, which were remitted later. The Government of India gave special grants in surplus years and this had a distorting influence on provincial finance. It never relinquished its supremacy and throughout retained its overall control over the financial administration, including creation of posts and revision of salary scales, of the provinces. It felt that responsibility for provincial solvency must rest with itself under an administration that was not responsible to the people. For this reason, the provinces could not budget for a deficit and were not given the right to raise loans or impose fresh taxation. In their zeal for improvement of local services, they might impose heavy burdens on the people which might be resented and add to the unpopularity of foreign rule.

### III. Montagu-Chelmsford Reforms

The Reforms of 1919 saw the beginnings of the new objective of provincial autonomy. The "divided heads" were abolished. Land revenue, excise, stamps, forests, registration and irrigation works, were wholly provincialized, while opium, salt, customs, income tax\*, railways, posts and telegraphs and military receipts were wholly Central. The provinces were also made responsible for the expenditure on irrigation and famine. These changes left the Government of India with a deficit. The Meston Committee\*\* estimated that, as a result of the constitutional changes, the provinces had an extra spending power of Rs. 18.50 crores at the cost of the Government of India. Accordingly, it fixed the provincial contributions to cover the Central deficit, estimated at Rs. 9.83 crores, as a proportion of the addition to the spending power of the different provinces. The Meston Settlement (1920) resulted in great inequalities, for example, the contribution of Tamil Nadu was Rs. 348 lakhs and of the United Provinces Rs. 240 lakhs, as against that of Maharashtra Rs. 56 lakhs and of Bengal Rs. 63 lakhs. This was strongly resented. Against the expectations of the Meston Committee,

---

\* As a result of agitation by the provinces, ultimately the provinces were given a share equal to 3 pies in each rupee on the excess of assessed income over that assessed in 1920-21. The provincial share was small, for example, Rs. 0.04 crore in 1936-37. This was, however, an important departure from the academic instance of the *Report on Constitutional Reforms* to the principle of complete bifurcation of revenue resources.

\*\* The committee was to advise on: (i) the contributions to be paid by the various provinces to the Central Government for the financial year 1921-22; (ii) the modifications to be made in the provincial contributions thereafter with a view to their equitable distribution until there ceases to be an all-India deficit; (iii) the future finance of the Provincial Loan Account; (iv) whether the Government of Bombay should retain any share of the revenue derived from income tax.

the provinces faced budgetary deficits. The contribution of Bengal had to be remitted successively from 1922-23. Further, as a result of improvement in Central finance, the contributions were partly remitted (Rs. 2.50 crores) in 1925-26 and (a further Rs. 1.25 crores) in 1926-27. They were wholly remitted in 1927-28 and were finally abolished in 1928-29. The provinces were given powers of taxation\* and borrowing subject to the control of the Government of India. The provinces had the system of dyarchy, whereby the provincial subjects were divided into "Reserved" and "Transferred". The "Transferred" subjects\*\*, consisting of social and nation-building services, were under the charge of Minister responsible to the provincial legislatures. The provincial Governors had powers of restoring any cuts by the legislature in the "Reserved" subjects but were bound by its resolution on the "Transferred" subjects. The provincial resources were to be used in the following order: first, contribution to the Government of India; secondly, needs of the reserved subjects; and thirdly, the requirements of the transferred heads. Thus, additional taxation would seem to be necessitated by the needs of the transferred subjects. Though the Central Legislative Assembly had an elected majority and possessed some control over a small proportion of the Central budget, this concession was nullified by giving to the Viceroy the power of certifying the budget if it was not passed by the Assembly.

Provincial Autonomy was inaugurated on April 1, 1937 by the Government of India Act, 1936, which abolished dyarchy. Provincial powers of taxation and borrowing were enlarged and normally the provinces enjoyed budgetary freedom from the Government of India. The provincial list of taxes was expanded and they took advantage of it by levying sales tax, agricultural income tax, etc. The Central taxes were also enumerated and the residuary powers were vested in the Central Government. Income tax, except tax on agricultural incomes, was to be administered by the Centre, but a part of the net proceeds was to be distributed among the provinces. Further, if the Central legislature so provided, export duties, salt duty and Central excise duties could be assigned, wholly or in part, to the provinces. In addition, Section 142 made provision for grants to the provinces. Sir Otto Niemeyer was asked to make specific recommendations\*\*\* on these balancing factors.

---

\* In the case of some taxes, such as, those on non-agricultural land, succession, betting and gambling, advertisements, etc. the provincial powers were not subject to the control of the Government of India.

\*\* These were excise, registration, education, medical, public health, local self-Government, agriculture, industries, scientific and miscellaneous departments, forests (in Bombay only) and civil works. The expenditure on transferred subjects was less than 49 per cent of the total provincial expenditure.

\*\*\* *Indian Financial Inquiry Report* by Sir Otto Niemeyer (1936). His recommendations were accepted by the British Government.

On his recommendation, 50 per cent of the net proceeds from income tax was assigned to the provinces\*, though the Centre retained a part of the provincial share till 1950-51. The share of the jute growing provinces in the export duty on jute was realized from 50 to 62.5 per cent. The entire debt of Assam, Bengal, Bihar, North West Frontier Province and Orissa to the Central Government was cancelled, so also part of the debt of the Central provinces. After taking account all these benefits, Sir Otto recommended tapering annual grants to the five provinces mentioned above, to ensure budgetary equilibrium and to enable them to start on an even keel. The total transfers to the provinces increased from Rs. 7.02 crores in 1937-38 to Rs. 51.61 crores in 1946-47 (of which the share of income tax was Rs. 1.25 crores and Rs. 29.87 crores, respectively) forming 7.8 per cent and 21.6 per cent, respectively of their total revenue. This indicates their increasing dependence on the Centre.

#### IV. Allocation of Financial Resources Between the Centre and the States

The Indian Constitution, which was inaugurated on January 26, 1950, allocates functions of common interest, belonging to the national or international sphere, to the Central Government, while those of local and regional interest are assigned to the States. This is a necessity in a country, with wide differences of language, religion, economic development and natural resources. The division of functions, as also of resources, is based broadly on the criteria of efficiency so that what belongs naturally to one Government has been placed in its sphere. Thus the Union Government is responsible for defence and foreign affairs, inter-State and international trade and commerce, navigation, aviation and national highways, posts, telegraphs, telephones, broadcasting, wireless currency, coinage, banking and insurance, etc. The States have been assigned police, public order, medical and public health, education, roads and bridges, agriculture and irrigation, forests, inter-State trade and commerce, etc. There is also a concurrent list to which belongs criminal law, economic and social planning, labour welfare, industrial disputes, social security, etc. The division of resources also follows the principle of efficiency\*\*. There is a clear bifurcation of tax jurisdic-

---

\* This was distributed among the provinces on the basis of residence and population, "Paying to neither factor a rigidly pedantic deference". However, little weightage was given to population.

\*\* The scheme of division follows broadly the pattern of the Government of India Act, 1935. The important changes are: (1) export duties are not shared with the States. This is necessary to ensure complete federal control over foreign trade. However, fixed grants were given for ten years to the jute growing States to compensate them and to enable them to adjust their finances, (2) some restrictions are

tion and a comprehensive enumeration of taxes so that competitive exploitation of the same tax and duplication of tax administration is avoided. The taxes under the legislative jurisdiction of the Union can be grouped under four categories: First, taxes whose entire proceeds are retained by the Union. These are corporation tax, import and export duties, taxes on capital other than agricultural land and surcharge on taxes under categories (2) and (3). Secondly, taxes whose proceeds are shared with the States. These are taxes on income (other than agricultural income) and excise duties except those assigned to the States. Thirdly, taxes whose entire net proceeds are assigned to the States. These are succession and estate duties on property other than agricultural land, terminal taxes on goods and passengers carried by rail, sea or air, taxes on railway fares and freights, taxes other than stamp duties on transactions in stock exchanges and future markets and taxes on the sale or purchase of newspapers and on advertisements published in them. Lastly, taxes to be collected and retained by the States. These are stamp duties mentioned in the Union List, taxes on inter-State sales and duties of excise on medicinal and toilet preparations containing alcohol, opium or such drugs. The jurisdiction of the States extended to land revenue, taxes on agricultural land and income, excise duties on alcoholic liquors, opium, Indian hemp, and other narcotic drugs, taxes on the sale and purchase of goods other than newspapers, taxes on lands and buildings and mineral rights, capitation taxes, tolls, stamp duties and registration fees. Taxes on the following are also assigned to the States: entry of goods into a local area, consumption and sale of electricity, advertisements other than those published in newspapers, goods or passengers carried by road or inland waterways, vehicles, animals or boats, professions, trades, callings and employments, luxuries including entertainments, amusements, betting and gambling. There is a provision that if a State or local authority was levying a tax (now in the Union List) before the commencement of the Constitution, then it can continue to do so until prohibited by Parliament. The residuary powers of taxation belong to the Union Government.

### V. The Problem of Financial Adjustment

The scheme of allocation assigns elastic and productive sources of revenue to the Centre while expanding social and development services are assigned to the States. The balancing factors are, therefore, of great

---

placed on the powers of the States to levy taxes on the sale and purchase of goods, (3) the limit to the total amount of taxes on professions, trades, callings and employments payable by any person is raised from Rs. 50 to Rs. 250 per annum, and (4) the Union Government has legislative jurisdiction over taxes on the sale and purchase of newspapers and advertisements published therein.

importance. The States derive substantial revenue from them and to give them fiscal independence, Constitution provides for a Finance Commission\*, to be appointed by the President, after every five years or earlier, to recommend the share of taxes and grants-in-aid to be paid to the States. Before the inauguration of the Constitution, the balancing factors were based on the recommendations of Sir Otto Niemeyer. With the partition of the country, the allocation of the provincial share of income tax was revised by the Government of India. This caused discontentment amongst some provinces and accordingly C. D. Deshmukh was asked to give a binding award to be applicable from 1950-51. He reallocated the released percentage comprising 14½ units relating to the areas/provinces that had formed part of Pakistan to the Indian provinces largely on the basis of population with some weightage in favour of the more needy provinces.

The Government of India also reduced the provincial share of the jute export duty to 20 per cent as about 70 per cent of the jute growing area of undivided India became part of Pakistan. The four affected provinces strongly protested against it. In view of the constitutional provisions, Deshmukh fixed the compensation to be paid to these provinces in lieu of the share of export duty on jute at Rs. 1.85 crores. The First Finance Commission increased it to Rs. 3.15 crores which was endorsed by the Second Commission. These grants lapsed after 1959-60.

The First Finance Commission raised the States' share of income tax to 55 per cent of the divisible pool\*\*. This was increased to 60 per cent by the Second Finance Commission, to 66½ per cent by the Third Commission and to 75 per cent by the Fourth Commission. The Fifth

---

\* The recommendations of the Finance Commissions so far appointed were almost wholly accepted. This convention should ensure fiscal independence to the States. The recommendations of the First Commission were for five years ending 1956-57, of the Second for the period ending 1961-62, and of the Third for the four years ending 1965-66, so that in future the period covered by the recommendations of the Finance Commission could synchronise with the five year period of the Plans. The Fourth Commission made recommendations for the five years ending March 31, 1971. However, the Commission's recommendations were applied only during the three years 1966-67 to 1968-69; when there were annual Plans. The recommendations of the Fifth Commission were for the five years ending March 31, 1974, to synchronize with the period of the Fourth Plan.

\*\* Divisible pool of income tax-total revenue from taxes on income other than corporation tax excluding Central surcharge, minus cost of collection and the portion attributable to Union emoluments and Union Territories. The advance tax collections were taken into account in determining the net proceeds of income tax only on the completion of regular assessments. Some State Governments represented to the Fifth Commission that the advance tax collections should form part of the divisible pool. The Commission took up this question with the Comptroller and Auditor-General and the Government of India, who agreed that the advance tax collections should form part of the net proceeds of income tax for that year. In accordance with the recommendations of the Fifth Commission, the State share of the unadjusted apportionment of advance tax for earlier years, amounting to Rs. 371 crores, was to be paid to them in three equal instalments in each of the years 1971-72, 1973-74 and 1974-75.

Commission did not change the share of the States. The First Commission distributed 20 per cent of the States' share on the basis of collection and the rest on the basis of population. The former percentage was reduced to 10 by the Second Commission but the Third Commission, to help the industrial States, restored the formula of the First Commission. This was endorsed by the Fourth Commission. The Fifth Commission recommended that 90 per cent of the States' share of the divisible pool should be distributed among them on the basis of population and "the remaining 10 per cent on the basis of figures of assessments after allowing for reductions on account of appellate orders, references, revisions, rectifications, etc."\*. Thus, the Fifth Commission restored the formula of the Second Commission.

The States were given, on the recommendation of the First Finance Commission, 40 per cent of the net proceeds of Union excise duties on tobacco (including manufactured tobacco), matches and vegetable products to be distributed among them on the basis of population. The Second Commission reduced the States' share to 25 per cent but added the excises on sugar, tea, coffee, paper, and vegetable non-essential oils to the divisible pool, so that the States' share was actually larger. It distributed 90 per cent of it on the basis of population and used the balance for adjustments. The Third Commission, impressed by State's needs and the shrinkage of the divisible pool of income tax following the reform in company taxation, increased the number of excisable commodities in the divisible pool from 8 to 35 by including all commodities (except motor spirit) on which the duty yielded more than Rs. 50

\* *Report of the (Fifth) Finance Commission, p. 28.* On the basis of the formula recommended by the Commission, it fixed the share of each State in respect of the financial years 1969-70 to 1973-74, as under (figures indicate the percentage share of each State):—

|                   |        |
|-------------------|--------|
| Andhra Pradesh    | 8.01   |
| Assam**           | 2.67   |
| Bihar             | 9.99   |
| Gujarat           | 5.13   |
| Haryana           | 1.73   |
| Jammu and Kashmir | 0.79   |
| Kerala            | 3.83   |
| Madhya Pradesh    | 7.09   |
| Maharashtra       | 11.34  |
| Karnataka         | 5.40   |
| Nagaland          | 0.08   |
| Orissa            | 3.75   |
| Punjab            | 2.55   |
| Rajasthan         | 4.34   |
| Tamil Nadu        | 8.18   |
| Uttar Pradesh     | 16.01  |
| West Bengal       | 9.11   |
| Total             | 100.00 |

\*\*The share of divisible taxes (received from the Union Government) is to be apportioned between Assam and Meghalaya in accordance with section 56(1) of the Assam Reorganisation (Meghalaya) Act, 1969.

lakhs. The States' share was fixed at 20 per cent to be distributed mainly on the basis of population, but the Commission gave some weightage to the backward States. The Fourth Commission recommended that 20 per cent of the net proceeds of all Union excise duties, including the duties which might be taken up for levy in the coming quinquennium, except regulatory duties, special excises and duties and cesses earmarked for special purposes, should be distributed among the States. They recommended that 80 per cent of the State share be distributed on the basis of population and 20 per cent on the basis of economic backwardness. The Fifth Commission did not agree to increase the State share but recommended that the revenue from special excise duties should be included in the divisible proceeds from the year 1972-73 in case such duties were continued. It recommended that 80 per cent of the States' share be distributed on the basis of population and out of the remaining 20 per cent "two-third should be distributed among States whose per capita income was below the average per capita income of all States in proportion to the shortfall of the States' per capita income from all States' average, multiplied by the population of the State and remaining one-third on the basis of an integrated index of backwardness.\*

As against special grants of Rs. 70 lakhs paid to Orissa and Assam in 1950-51, the First Finance Commission gave special grants of Rs. 5.05 crores per annum to seven States\*\* besides specific grants for the spread

\* On the basis of the formula recommended by them, the Commission worked out the share of each State as under (figures indicate percentage share of each State):

|                   |               |
|-------------------|---------------|
| Andhra Pradesh    | 7.15          |
| Assam             | 2.15          |
| Bihar             | 13.81         |
| Gujarat           | 4.17          |
| Haryana           | 1.49          |
| Jammu and Kashmir | 1.12          |
| Kerala            | 4.28          |
| Madhya Pradesh    | 8.48          |
| Maharashtra       | 7.93          |
| Karnataka         | 4.65          |
| Nagaland          | 0.08          |
| Orissa            | 4.72          |
| Punjab            | 2.17          |
| Rajasthan         | 5.28          |
| Tamil Nadu        | 6.50          |
| Uttar Pradesh     | 18.82         |
| West Bengal       | 6.84          |
| Total             | <u>10.000</u> |

\*\* Assam, Mysore (Karnataka), Orissa, Punjab, Saurashtra, Travancore, Cochin and West Bengal.

of primary education to eight backward States<sup>1</sup> rising from Rs. 150 crores in 1953-54 to Rs. 300 crores in 1956-57. The Second Commission gave special grants to eleven States<sup>2</sup> rising from Rs. 36.25 crores in 1957-58 to Rs. 39.50 crores in 1961-62. These were increased following the recommendation of the Third Commission<sup>3</sup>, to Rs. 110.25 crores per annum payable to all the States except Maharashtra, besides a grant of Rs. 9 crores per annum (approximately equal to 20 per cent of the proceeds from the excise duty on motor spirit) to ten States<sup>4</sup> for improvement of communications. The Fourth Commission recommended annual grants of Rs. 121.89 crores to ten States<sup>5</sup>. The Fifth Commission recommended grants to ten States<sup>6</sup>, gradually declining from Rs. 152.73 crores in 1969-70 to Rs. 102.41 crores in 1973-74.

In addition, the following revenues are also distributed amongst the States on the recommendation of the Finance Commissions appointed from time to time: (1) additional duties of excise (in lieu of sales tax levied by the States) imposed in 1957-58 on mill-made textiles (excluding silk fabrics), sugar and tobacco (including manufactured tobacco) and in 1961-62 on silk fabrics; (2) estate duty (excluding that on agricultural land, which accrues to the States that have authorized the Centre to impose it and in which such land is situated), and (3) tax on railway passenger fares imposed on September 15, 1957, and abolished from April 1, 1961, when it was merged in passenger fares. The railways thereafter provided Rs. 12.5 crores annually in lieu of the tax. On representations made by the State in view of the increase in traffic, the Railway Convention Committee (1965) agreed that this grant be increased to an amount equal to one per cent of the capital at charge on March 31, 1964, out of which Rs. 16.25 crores may be paid as grant to States in lieu of the repealed tax and the balance of about Rs. 1.50 crore may be utilized to assist the States to provide their share of the cost of Railway safety works.

---

1. Bihar, Hyderabad, Madhya Bharat, Madhya Pradesh, Orissa, P.E.P.S.U., Punjab and Rajasthan.

2. Andhra Pradesh, Assam, Bihar, Kerala, Madhya Pradesh, Karnataka, Orissa, Punjab, Rajasthan, West Bengal and Jammu and Kashmir.

3. The Government of India did not agree that 75 per cent of the revenue component of the State Plans be included in the scheme of devolution. This was not a unanimous recommendation and its non-acceptance did not affect the total amount of Central assistance to the States. If the Commission's recommendation was accepted these would be statutory grants and would lack flexibility.

4. Andhra Pradesh, Assam, Bihar, Gujarat, Jammu and Kashmir, Kerala, Madhya Pradesh, Karnataka, Orissa and Rajasthan.

5. Andhra Pradesh, Assam, Jammu and Kashmir, Kerala, Madhya Pradesh, Tamil Nadu, Karnataka, Nagaland, Orissa and Rajasthan.

6. Andhra Pradesh, Assam, Jammu and Kashmir, Kerala, Karnataka, Nagaland, Orissa, Rajasthan, Tamil Nadu and West Bengal.

Table 1\* shows the increasing dependence of the States on the devolution of funds from the Centre,\*\* which (excluding loans) formed 24.1 per cent of their total revenue expenditure during the First Plan and 35.8 per cent during the Second Plan. This percentage declined to 34.4 during the Third Plan but rose to 37.3 during the three Annual Plans (1966-69) and to 45.2 in 1971-72 (Budget). While it solves the problem of financial disequilibrium, it violates the principle of Financial Responsibility. There is divorce of revenue raising and spending powers. There is, however, a preponderance of unconditional grants and share of taxes which the States are free to utilize as they like. This gives fiscal independence to the States and has neither encouraged extravagance in expenditure nor laxity in tax collection. In the case of specific or conditional grants, the Union Government provides the funds while the States are responsible for the execution of the projects. This divided responsibility results in delay and inefficiency in the execution of the schemes. The problem bristles with difficulties and on its solution will depend the future of federalism in India. Though the dependence of the States on the Centre has been increasing, they have not become mere departments of the Government of India and have asserted their rights whenever they have found it necessary to do.

#### VI. Financial Integration of Princely States

At the time of independence, there were about 555 Princely States. The genius of Sardar Vallabh Bhai Patel brought them into an integral relationship with the Indian Union. The process began on January 1, 1948, and was completed within two years. "This bloodless revolution has been brought about, on the one hand, by the operation of democratic forces unleashed by freedom and, on the other, by the patriotic attitude of the Rulers who have been quick to appreciate the change." The smaller States were merged in the provinces of India or into Unions of States known as Part B States.\*\*\* Though Part B States were politically integrated, many of them had their own army, coinage system, railways and post offices. The Union Government had no right to levy federal taxes in their territories. These States were financially integrated with the Union of India on April 1, 1950\*\*\*\*, on the basis of the

\*See Appendix.

\*\*The percentage of shared taxes, grants and net loans made available by the Centre to the States formed 36.0 per cent of their total expenditure on capital and revenue account during the First Plan. This percentage rose to 41.9 during the Second Plan, and to 43.4 during the Third Plan. It, however, declined to 41.7 during the annual Plans, and to 40.4 in 1971-72 (Budget).

\*\*\*These were Hyderabad, Madhya Bharat, Karnataka, P.E.P.S.U., Rajasthan, Saurashtra and Travancore-Cochin. The former British Indian Provinces were known as Part A States, while the Centrally administered areas were known as Part C States.

\*\*\*\*Except P.E.P.S.U. which was integrated on April 13, the beginning of its financial year.

recommendations of the Indian States Finances Enquiry Committee (1948-49). Thereafter, the Union Government acquired the same functions and fiscal powers in these States as in the rest of India, though some time-lag was permitted to raise the rates of federal taxes on income to the all-India level and to abolish the internal customs duties levied in some of these States. In the case of States whose revenue gap (the difference between revenue and expenditure taken over by the Union Government) was positive, which measured their financial loss as a result of integration, the Union Government gave, to prevent any dislocation in their finances, tapering revenue gap grants for ten years. The revenue gap of Madhya Bharat, P.E.P.S.U., and Rajasthan was negative and they were not to compensate the Union Government. Part B States became entitled to a share of divisible federal taxes, which was set off against the revenue gap grants, if any. If their share of federal taxes exceeded their revenue gap, they were entitled to the former. A similar principle was applied to Part A States with respect to Princely States merged in them. Jammu and Kashmir was financially integrated on May 14, 1954. In this case, the power of Parliament to make laws is regulated by Article 370 of the Constitution. The distinction between Part A and B States was abolished on the reorganization of the States in 1956. Thus, independent India, though truncated in size due to partition, has achieved fiscal and economic unity.

#### VII. Union and State-Budgets : Growth of Revenue and Expenditure

During the last three decades, momentous events took place in India, which produced a marked impact on Government finances. Burma was separated on April 1, 1937, and this caused a net loss of Rs. 2.33 crores to the Central exchequer. The inauguration of Provincial Autonomy imposed an additional burden of about Rs. 5.80 crores in the first year. The Second World War increased the expenditure on defence, which rose from Rs. 46.18 crores in 1938-39 to Rs. 395.49 crores in 1944-45, the last full year of war. Nationalist opinion rightly felt that a part of it was unjustly debited to the Indian exchequer. There was also a considerable increase in the expenditure on civilian services connected with the war, so that the Central expenditure increased from Rs. 85.11 crores in 1938-39 to Rs. 496.25 crores in 1944-45 or by 484 per cent. To meet the increased expenditure, the rates of existing taxes were increased and some new taxes, such as the Excess Profits Tax and new excise duties, were imposed. Railway fares and freights and postal and telegraph charges were also increased. These measures, along with the increased activity generated by the war, helped to boost up revenue, which increased from Rs. 84.47 crores in 1938-39 to Rs. 335.70 crores in 1944-45 or by 300 per cent. Since expenditure increased more rapidly, the Government of India resorted to a large borrowing pro-

gramme and introduced a scheme of compulsory savings in the case of excess profits. Despite this, the Government failed to bridge the inflationary gap and there was a steep rise in prices, which had its impact on the Government's expenditure and revenue.

The provinces were able to build up Revenue Reserve Funds, which exceeded Rs. 60 crores at the end of the war. Their expenditure also increased, but relatively less rapidly due to rise in prices, increase in the police budget and civil defence measures and the prevalence of scarcity conditions, which necessitated the Grow More Food Scheme and measures for the control and distribution of food and other commodities. Their revenues increased due to war activity and the increase in taxation to mop up surplus purchasing power. New taxes, such as, the sales tax, agricultural income tax and urban immovable property tax, were also imposed.

As a result of developments that followed the termination of the war, India achieved independence on August 15, 1947, though it was accompanied by the partition of the country. The wisdom of British diplomacy and the sagacity of Mahatma Gandhi enabled India to achieve independence through peaceful means. However, the pangs of partition were painful. The serious communal disturbances resulted in the mass evacuation of Hindus from West and East Pakistan. This imposed a heavy burden on the Government for their relief and rehabilitation. The expenditure on foreign affairs also increased. The progress in the reduction of defence expenditure was halted. There is a large land frontier, with no natural barriers, with Pakistan with whom relations have not been satisfactory. The paramountcy of the Government of India over the princely States lapsed with the grant of independence and some of them threatened to remain independent and increased their armed forces. The Kashmir operations also emphasized the need for a strong army. After the political and financial integration of the princely States, their armed forces were merged with Indian defence forces, which increased the defence bill. Relations with Pakistan deteriorated as a result of its attitude towards the Chinese aggression on India in 1962. There have been frequent border raids and though the cease-fire is operative in Kashmir, provocative speeches by responsible leaders of Pakistan and threats to use force to solve the Kashmir issue, which culminated in the Pakistan aggression of 1965, necessitate vigilance on the part of our defence forces. On account of our faith in the philosophy of peace, and the need to accelerate economic development, our defence expenditure has been very modest. In 1959, it was 1.9 per cent of our gross national product while this percentage was 10.0 for Burma, 8.7 for Viet Nam, 7.7 for Korea, 4.6 for Indonesia, 4.0 for Pakistan and 9.6 for the U.S.A. In 1959, the percentage of our defence expenditure to the total expenditure of the Union and State Govern-

ments was 15.4, whereas this percentage in the case of other countries was as follows: Pakistan 30.9, Korea 35.3, Burma 37.8, Viet Nam 39.0, Indonesia 39.8, and the U.S.A. 41.6. Pakistan, Korea and Viet Nam receive substantial U.S. military assistance and to that extent their defence expenditure is under-stated. The arms assistance from the U.S.A., U.K. and other friendly countries was received by us only after the Chinese aggression in October 1962, which has brought about an important historical change. For thousands of years, the Himalayan frontier has been peaceful and unguarded. It has now become a live and dangerous frontier. The effect of deteriorating relations with Pakistan and the Chinese aggression is reflected in the rapid growth of defence expenditure.

The attainment of freedom raised new hopes and aspirations amongst the masses. A popular Government had to justify the trust reposed in it and had to undertake a large social and development programme to fulfil the promises it had made to the people. The Planning Commission was set up in March 1950 to accelerate economic development. A large development programme compelled the Government to resort to deficit financing\* which led to a rise in prices. This forced the Government to increase the salary and allowances of its employees and has also increased other expenditure. The financial integration of Part B States involved the taking over of federal services by the Government of India. They also became eligible for federal grants and other financial and technical assistance like Part A States. Both these factors increased the Central expenditure. The State Governments are responsible for social and developmental services, but they do not have the resources to finance them. Consequently, grants-in-aid to the States have increased. The increase in social and developmental expenditure has also increased the expenditure on administration. A large capital expenditure has increased the interest bill. The cumulative effect of all these factors has been that in almost each post-independence year, the Union Government's expenditure achieved a peace-time record.

The expenditure of the State Governments also increased rapidly. Every year it attained a peace-time record. The causes are rise in prices,

---

\* In the Indian context, this implies borrowing funds from the Reserve Bank of India resulting in an expansion of currency. The extent of deficit financing was Rs. 420 crores in the First Plan and Rs. 948 crores in the Second Plan. On account of an increase in the money supply, the index number of wholesale prices (1952-53=100) declined from 111.8 in 1950-51 (average of weeks) to 98.1 in March 1956, but increased to 128.4 in March 1961. The quantum of deficit financing during the Third Plan was Rs. 1,133 crores. It was Rs. 723 crores during the Annual Plans 1966-69. In the Fourth Plan the provision for deficit financing was Rs. 850 crores, forming 5 per cent of the total resources as against 13 per cent in the Third Plan. The dependence on deficit financing had to be reduced on account of continuous rise in prices. The index number of wholesale prices (1961-62=100) rose to 131.6 (average of weeks) in 1965-66 and to 165.4 in 1968-69 (average of weeks). It continued to rise thereafter and was 181.2 (average of weeks) in 1970-71. The index had risen to 189.1 in the last week of July, 1971.

increased pay scales and allowances of employees, expansion of social and development services, increase in expenditure on civil administration and debt services. Since 1950-51, development expenditure was increased by 1,047 per cent as against an increase of 708 per cent in non-Government expenditure. Education has rightly received the highest priority. The future progress of the country depends on increasing opportunities for technical and general education. Under adult franchise, the importance of removing illiteracy cannot be over-emphasized. The percentage of literacy has increased from 16.6 in 1951 to 24.0 in 1961 and to 29.0 in 1971. The increased expenditure on medical and public health has paid rich dividends and the average expectation of life increased from 32.4 years during 1941-50 to 41.9 years during 1951-60. The large increase in the expenditure on agriculture and rural development is fully justifiable since agriculture accounts for 48 per cent of the national income and 82 per cent of the population lives in rural areas.

The increase in expenditure has emphasized the need for economy and efficiency. There is a strong feeling that more men are employed in Government departments than are necessary to do the work efficiently. The reports of the Estimates Committee and the Public Accounts Committee emphasize instances of waste, inefficiency and bad planning. There are also numerous complaints of corruption, bribery and nepotism. It is necessary to reduce the cost of Government and to impose severe penalties in proved cases of corruption and nepotism. The Government is aware of the need for economy and the recommendations of Economy Committees in the States have reduced unnecessary expenditure. The Union Government also has machinery to secure economies in expenditure. The Organization and Methods Division in the Cabinet Secretariat, tries to improve the efficiency of administration. The Department of Expenditure in the Ministry of Finance has an Economy Division which examines all proposals, requiring the sanction of the Ministry, with the object of securing utmost economy. It has a Special Reorganization Unit, which explores improvements in the methods of work, so that it can be done with lesser staff. It works out suitable standards to measure the work that can be done, and is actually done, by each employee. The Internal Economy Committee in the different Ministries and departments constantly examine ways and means of quicker disposal and try to reduce expenditure on staff and contingencies. The Central Economy Board examines cases of disagreement between the Special Reorganization Unit and the Ministry concerned and the extent to which the proposals of the former should be enforced. The National Development Council has set up a committee on Plan Projects, which scrutinizes the projects and appoints teams to visit selected projects to examine their working thoroughly with the object

of avoiding waste and ensuring economy and efficiency in their execution.

The large increase in expenditure necessitated adequate expansion in revenues. Since 1950-51, Central and State revenues have increased by 806 per cent and 876 per cent respectively. Central revenues have increased as a result of financial integration of princely States, increase in the rates of existing taxes, imposition of new taxes and expansion of administrative receipts and the net contribution of public undertakings. Since 1950-51, tax revenues collected by the Union and State Governments have increased by 741 per cent and 624 per cent respectively. This reflects the comparative inelasticity of State taxes and explains the dependence of the States on the balancing factors. State revenues have increased on account of large transfers from the Union Government, increases in the rates of existing taxes, imposition of new taxes and an increase in the contribution of public enterprises and administrative receipts. While increased revenues have enabled the Union and State Governments to expand social and development services, they have also sacrificed revenue on sentimental and ideological grounds — the abolition of the salt duty and the policy of prohibition.

An important development in the post-independence period is that the Union Government has deliberately planned large revenue surpluses, which have helped to reduce the extent of deficit financing. Since independence, the revenue surplus amounted to Rs. 386 crores (of which Rs. 250 crores was during the First Plan) till the end of the First Plan. During the Second Plan, it was Rs. 220 crores and rose to Rs. 1,019 crores during the Third Plan. It was Rs. 414 crores during the three Annual Plans and was Rs. 125 crores in 1969-70, Rs. 198 crores in 1970-71 (Revised) and Rs. 153 crores in 1971-72 (Budget). Thus, the total revenue surplus till the end of March 1972 (Budget) amounted to Rs. 2,515 crores. The technique of financing capital expenditure out of revenue surpluses has helped in the fight against inflation.

As a result of continuous increases in taxation, the percentage of national income raised in taxation by the Union and State Governments increased from 6.6 in 1950-51 to 7.6 in 1955-56 and to 9.5 in 1960-61. It has since increased to 13.2 in 1968-69 and to about 14 per cent in 1970-71.

### VIII. Capital Expenditure

Since independence, there has been a large increase in capital expenditure, to make up for the neglect of the past. Under British rule, the Government followed a conservative policy with respect to development expenditure. The total capital outlay of the Central Government was Rs. 1,239 crores and of Part A states (including the undivided provinces of the Punjab and Bengal) Rs. 208 crores till the end of March 1947.

Since independence, the capital outlay of the Government of India was Rs. 473 crores and of Part A States Rs. 173 crores till the end of 1950-51. Since then, it has considerably increased. In the post-independence period, capital expenditure has been restricted by the ability of the Government to raise funds through non-inflationary methods of finance. It is, therefore, necessary that public enterprises should follow a price policy that helps rapid economic development. Their surpluses should be enlarged to finance new projects. So far, the net contribution of public enterprises has been too small as compared to the large capital outlay on them.

There is great misunderstanding, especially abroad, about our objective of establishing a socialistic pattern of society. It is due to the use of the word 'socialistic' and the large capital outlay of the Government. It is, therefore, necessary to emphasize — and the Government has repeatedly clarified it — that the 'socialistic pattern' does not mean that the State intends to own, now or ultimately, all the means of production or that it will nationalize all existing and new private industries. Our objective implies that the country's existing and potential resources should be fully exploited so that the standard of living of the masses, which is pitifully low, may rise quickly. This necessitates that the fruits of economic development should be equitably shared by all, so that existing inequalities are reduced and there is no concentration of economic power. In an under-developed country like India, there are vast investment opportunities, but enterprise is shy and capital is lacking. Private enterprise wants to invest in tried and safe channels, where the gestation period is short and returns are reasonably quick. The people are unfamiliar with the investment habit so that private industrialist cannot take up projects which require a high amount of capital and take several years to complete and another few years to be profitable. The construction of railways, irrigation works, multiple purpose river valley projects and even modern steel plants, are beyond the resources available to private enterprise. Even under the British rule, these projects, except steel plants, had to be State-owned. Lord Canning, in the fifties of the last century, tried the experiment of entrusting the investment on irrigation works to private enterprise. Two companies took up the Tungabhadra and Orissa canal projects and both of them failed. The Government alone has the patience and resources to finance such projects in under-developed countries as the outlay is large and the profits accrue after several years. The construction of railways began under the Company's rule, but till the end of the 19th century they were a financial loss to the Government. There is really no conflict between private and public enterprise in India. There are vast opportunities for both and these will continue to expand. In spite of investment by the Government, there is no shortage of investment opportunities for private enterprise.

### **IX. Revenue and Expenditure of Local Bodies**

Lord Mayo (1869-72) encouraged local bodies to rouse local interest and supervision in the management of funds devoted to local welfare. Lord Ripon (1880-84) regarded them as good training ground for popular and political education and accordingly shifted the emphasis to 'Local Self-Government.' The next important landmark is the Government of India Act 1919, which made it a "transferred" subject and the Scheduled Taxes Rules framed under it reserved eleven taxes for local authorities. The self-Government aspect developed further on the inauguration of Provincial Autonomy and the attainment of independence. The constitutional directive that the State shall take steps to organize village panchayats as units of self-Government visualizes "development from below" and emphasizes the importance of local Government as an effective instrument for the democratic decentralization of political and economic power.

The Government of India Act 1935, bifurcated financial resources between the Central and State Governments and abolished the reservation of taxes for local bodies. This position continues under the Constitution. The result is that State Governments, burdened with large development outlays, coupled with the sacrifice of revenue due to prohibition, have encroached on local taxes, such as, profession tax, urban immovable property tax, entertainment tax, etc. The State Governments have also invaded the field of public enterprise which works more efficiently under local control. Instances are city transport, electric supply, etc. The consequence is that local bodies are starved of funds and are unable to play their proper role in providing civic amenities. In 1950-51, the share of Union and State Governments was 42 per cent and 49 per cent respectively in total governmental expenditure while that of local bodies was 9 per cent. In the U.S.A., the States and local authorities incurred 18 per cent and 19 per cent respectively of total governmental expenditure in 1950-51 and nearly the same percentages in 1962-63. The State Governments are relatively more important in our federal system.

Local bodies are eminently suited to provide certain social services, such as, primary education, sanitation, drainage, water supply, lighting, parks, local and feeder roads, public health, medical relief, regulation of offensive or dangerous trades, improvement of slums, etc. These functions can be performed efficiently if adequate resources are available. Impressed by the divergence in the functions and resources of local bodies, the Local Finance Enquiry Committee (1949-50) rightly held that, "wholesale transfer of functions from local bodies to State Governments is a retrograde step and should be avoided." It has, against a constitutional amendment, to reserve specified taxes for local bodies and recommended that a convention should be developed to that effect. The

Taxation Enquiry Commission (1953-54) was also against amending the Constitution and recommended that some taxes should be reserved for local bodies and panchayats and rural boards should be given at least 15 per cent of the yield from land revenue and municipalities and district boards at least 25 per cent of the revenue from motor vehicles taxes. The State Governments have not accepted these recommendations on account of financial stringency. It would be better if the Government of India, which gives substantial assistance to the States, uses its influence with them to increase the resources of local bodies.

The Taxation Enquiry Commission reported that there were 12 municipal corporations, 1,426 municipalities, 379 small town and notified area committees, 56 cantonment boards, 196 district boards, 96 rural boards and 87,018 village panchayats, whose number increased to 193,527 on March 31, 1961. There are some port trusts also. In recent years several big cities have set up improvement trusts and town planning bodies, which do not exercise powers of taxation. There is a great dearth of statistics of the revenue and expenditure of this large body of local authorities and it is necessary to fill this gap. The Local Financial Enquiry Committee estimated that in 1946-47 the total income of municipalities and corporations, covering a population of 2.7 crores, was Rs. 27.5 crores, of which about 70 per cent was from taxation. The total income of district boards, covering a population of 20.5 crores, was Rs. 15.6 crores — of which about 34 per cent was from taxation. The Taxation Enquiry Commission estimated that the income of municipalities was Rs. 35.55 crores, of which Rs. 4.31 crores or 12 per cent was from grants-in-aid and Rs. 22.77 crores or 63 per cent from taxation. The important tax sources were (all in crores) octroi Rs. 6.32, terminal tax Rs. 1.83, property tax Rs. 5.23, services tax Rs. 5.08, tolls Rs. 0.85, theatre tax Rs. 0.83, taxes on vehicles, animals and boats Rs. 0.48, profession tax Rs. 0.41, and taxes on passengers and goods Rs. 0.34. Octroi is the most important tax source. It is, however, a vexations tax, involving maintenance of road barriers and delegation of wide powers to petty officials. It should be replaced by terminal taxes and preferably by a local surcharge on State sales tax, which will introduce elasticity in local tax structures. The total expenditure of municipalities was Rs. 33.15 crores, of which Rs. 13.35 crores, or 40 per cent, was on drainage, conservancy, etc., Rs. 4.52 crores on roads and buildings. Rs. 3.56 crores on medical and health and Rs. 3.55 crores on administration. The total income of corporations which have wider functions and ampler powers of taxation, was Rs. 24.06 crores — of which Rs. 18.45 crores or 77 per cent was tax revenue. The chief tax sources were (all in crores): property tax Rs. 9.61, service taxes Rs. 4.46, octroi and terminal taxes Rs. 2.39, taxes on vehicles, animals and boats Rs. 0.74, profession tax Rs. 0.43 and theatre tax Rs. 0.27.

The Reserve Bank of India conducted surveys on the finances of city corporations, port trusts and municipalities in towns with a population exceeding 1,00,000. The following data covers 63 local authorities (4 port trusts, 17 corporations and 42 municipalities) which furnished returns as against 83 that were addressed. Their total receipts (revenue and capital account) increased from Rs. 92.7 crores in 1955-56 to Rs. 181.9 crores in 1960-61 (Revised). During this period, the revenue from rates and taxes increased from Rs. 29.4 crores to Rs. 73.8 crores or by 151 per cent, while grants from the Government increased from Rs. 4.1 crores to Rs. 9.3 crores, and loan receipts increased from Rs. 17.7 crores to Rs. 23.4 crores. During the same period, the expenditure on general administration increased from Rs. 10.4 crores to Rs. 16.8 crores or by 62 per cent, while that on public health and conveniences increased from Rs. 3.8 crores to Rs. 36.9 crores or by 871 per cent and on public works from Rs. 5.3 crores to Rs. 36.8 crores or by 594 per cent; yet civic amenities have not increased proportionately due to rise in prices and large influx of population. Their outstanding debt increased from Rs. 125.4 crores at the end of March 1956 to Rs. 201.9 crores at the end of March 1961, of which Rs. 77.1 crores and Rs. 107.1 crores respectively were market loans and Rs. 48.2 crores and Rs. 87.1 crores respectively were loans from the Union and State Governments. Gross capital formation in 1960-61 amounted to Rs. 30 crores or 15 per cent of their total disbursements.

The Reserve Bank survey on the finances of port trusts, municipal corporations and municipalities in towns with a population exceeding 1,00,000 (on the basis of the 1961 Census) for the years 1962-63 to 1965-66 covers 5 port trusts, 14 corporations and 63 municipalities which replied to their questionnaire as against 108 that were addressed. The total number of urban local bodies in 1961 was 1,860 with a population of 692 lakhs. The population covered by the local reporting authorities was 241 lakhs or 35 per cent of the total urban population covered by all local authorities. Their total receipts (revenue and capital account) increased from Rs. 214.05 crores in 1962-63 to Rs. 282.43 crores in 1965-66 (Budget) or by 32.0 per cent. During this period, the revenue from rates and taxes increased from Rs. 83.57 crores to Rs. 108.23 crores or by 23.0 per cent, while receipts from remunerative enterprises increased from Rs. 9.08 crores to Rs. 26.38 crores or by 192.2 per cent, grants from Government increased from Rs. 10.40 crores to Rs. 12.66 crores or by 21.7 per cent, and loan receipts increased from Rs. 23.59 crores to Rs. 40.01 crores or by 69.6 per cent. During the same period, the expenditure on general administration increased from Rs. 18.58 crores to Rs. 22.50 crores or by 21.1 per cent, while that on public health and conveniences increased from Rs. 30.97 crores to Rs. 50.97 crores or by 64.5 per cent, that on public works from Rs. 17.88 crores to Rs.

30.78 crores or by 72.1 per cent, that on public instruction from Rs. 13.93 crores to Rs. 30.87 crores or by 121.9 per cent and on remunerative enterprises from Rs. 10.47 crores to Rs. 15.15 crores or by 44.6 per cent. Their outstanding debt increased from Rs. 246.35 crores at the end of March 1963 to Rs. 283.04 crores at the end of March 1965 (or by 14.9 per cent), of which Rs. 111.61 crores and Rs. 119.01 crores respectively were market loans and Rs. 120.51 crores and Rs. 143.96 crores respectively were loan from Government. Gross capital formation increased from Rs. 19.82 crores in 1962-63 to Rs. 36.73 crores in 1965-66 or by 85.4 per cent.

The most important source of tax revenue of district and local boards is the land cess, which generally varies from 6½ per cent to 12½ per cent of land revenue. The Taxation Enquiry Commission reported that the total income of district boards was Rs. 27.63 crores, of which Rs. 11.99 crores, or 43 per cent, was from grants-in-aid. Their tax revenue was Rs. 10.19 crores, the main sources being (all in crores), land cess Rs. 7.31, duty on transfer of immovable property Rs. 1.06, local rates Rs. 0.79, tolls Rs. 0.46, property tax Rs. 0.20, profession tax Rs. 0.16, octroi and terminal tax Rs. 0.07, and taxes on animals and vehicles Rs. 0.05. The per capita incidence of their taxation was about one-twelfth of municipal taxation. Their position is becoming untenable as some of their functions have been taken over by panchayats and some others, such as, roads, medical and public health, etc., by the States.

The village panchayats derive most of their revenue from grants and taxes. Their establishment has curtailed the resources of local boards. They can levy property tax, profession tax, service taxes, taxes on animals and vehicles, octroi, cess on land revenue, tolls, theatre tax, etc. The exercise of their tax powers is subject to the approval of the State Governments. They are authorized to require all adult able-bodied male residents to give free labour for some days in a year (or its money equivalent) for building community assets. In 1951-52, the total revenue of 54,263 panchayats in Bihar, Kerala, Karnataka, Punjab and Uttar Pradesh was Rs. 1.26 crores, of which Rs. 0.60 crores, or 48 per cent, was from taxes, Rs. 0.17 crore from grants and Rs. 0.14 crore from fees and fines.

## XI. Tax Structure

During the East India Company's regime, the taxes which it inherited from the local rulers were continued. Except for land revenue, the system of direct taxation was almost unknown. The *moturpha* was a direct tax levied on artisans, traders, etc. It was universally detested and yielded a small revenue. Accordingly, it was abolished in Bengal in 1793 and in other provinces (except Madras, where it was abolished at the end of the Company's rule) by 1844. The Company never cared to evolve

a coherent system of taxation and depended mostly on land revenue. This dependence continued under the Crown, though, with the development of other taxes, the percentage contribution of land revenue to total tax revenue declined from 43.9 in 1870-71 to 38.6 in 1900-01\* when it yielded Rs. 26.2 crores. The concept of a tax structure based on equity was unknown to the 19th century unrepresentative Government. Land revenue has been an inelastic source of revenue: its yield increased to Rs. 31.1 crores in 1911-12 and to Rs. 34.7 crores in 1921-22. During the same period, the increase in revenue from the other principal taxes was (all in crores); customs Rs. 9.6 to Rs. 34.4, income tax\*\* Rs. 2.4 to Rs. 22.1, excise Rs. 11.4 to Rs. 17.2 and salt Rs. 5.1 to Rs. 6.3, while the opium revenue declined from Rs. 8.8 to Rs. 3.1. With doses of representative Government, there was an increase in tax revenue combined with an expansion of social and development services. Provincial revenues increased from Rs. 70.4 crores in 1921-22 to Rs. 92.3 crores in 1935-36 or by 31 per cent, whereas the revenues of the Central Government, where little progress was made towards popular control, increased during the same period from Rs. 115.2 crores to Rs. 117.8 crores or by 2 per cent only. The grant of Provincial Autonomy and the strains of the Second World War led to a search of fresh sources of revenue and new taxes, like the excess profits tax, new excise duties, sales tax, agricultural income tax, etc., were imposed to make the tax structure more equitable and broad based. Since independence, taxation has assumed a new role as it is an important source of financing the development programme. It is, therefore, necessary to have a scientific structure of taxation which is geared to the needs of development finance.

Taxation is the most important source of Government revenue. It formed 77 per cent of the total revenue of the Union and State Governments in 1970-71 (Budget). The tax system must transfer adequate resources to the Government. Income tax assesses form about 0.5 per cent of the population in India as against about 35 per cent in the U.K. and 26.7 per cent in the U.S.A. In 1968-69, the revenue from income tax on the non-corporate sector formed 1.26 per cent of the national income in India as against 11.34 per cent in the U.S.A. Accordingly, the Government has to rely more on indirect taxes in India. To achieve equity, heavier taxes are levied on luxuries and commodities mostly consumed by the well-to-do sections of the community.\*\*\* Commodity taxes are also useful to restrict the consumption of harmful commodities, like liquors and intoxicating drugs. They also help to economize

---

\* In 1970-71 (Budget) land revenue yielded Rs. 110 crores forming 2.46 per cent of the total tax revenue of the Union and State Governments.

\*\* The income tax was first levied temporarily in 1860 in the form of a licence tax and finally reimposed by the Act of 1886.

\*\*\* Recent budgets of the Union Government have kept these objectives in view.

the consumption of commodities that are required for export or for the development programme. Import duties can be used to encourage import substitution and to mop up excessive profits of importers, which inevitably accrue under conditions of import control.

### XI. Growth of Revenues

Estate duty was levied with effect from October 15, 1963. It is imposed on agricultural land also in those States that have authorized Parliament to do so. The present exemption limit is Rs. 50,000. The rate of tax rises from 4 per cent on the next slab of Rs. 50,000 to 85 per cent in the case of slabs exceeding Rs. 20 lakhs. Taxes on gifts and expenditure (which were imposed under the residuary powers of the Union Government and do not, therefore, apply to Jammu and Kashmir) were imposed from April 1, 1959. The Gift Tax exempts annual gifts upto Rs. 5,000. It is levied at 5 per cent on the first taxable slab of Rs. 5,000 rising to 75 per cent on slabs exceeding Rs. 20 lakhs. The Expenditure Tax, which yielded a small revenue was suspended from April 1, 1962. It was revised from the assessment year 1964-65 (that is, with respect to the expenditure incurred during the financial year 1963-64). The tax was abolished with effect from April 1, 1966. Annual expenditure upto Rs. 30,000 was exempt from tax. In the case of Hindu undivided families, the exemption limit depended upon the number of coparceners in the family, subject to a maximum of Rs. 60,000. In addition there were liberal exemptions and deductions in computing taxable expenditure. The tax was levied at 10 per cent on the first Rs. 10,000 of taxable expenditure, rising to 100 per cent on taxable expenditure exceeding Rs. 50,000. Realized capital gains, arising on or after April 1, 1956, are taxed. The first Rs. 5,000 of all capital gains plus 36 per cent of capital gains on land and buildings and 50 per cent of the capital gains on other assets are exempt from tax and the balance is added to the assessee's income. The taxpayer has the option of adopting, instead of the actual cost of the capital asset, its fair market value as on January 1, 1954. In the case of non-company assessee, capital gains are not taxed if they do not exceed Rs. 5,000 or the total income including them does not exceed Rs. 10,000. Realized capital gains of the corporate sector are taxed at the rate of 45 per cent if they accrue on lands or buildings and at 35 per cent if they accrue on other assets. The Wealth Tax was imposed from April 1, 1967. The first slab\* of Rs. 2 lakhs of net wealth in the case of individuals and Rs. 4 lakhs in the case of Hindu undivided families is exempt from tax, while agricultural land was not included in

---

\*The entire capital gains on assets held for less than two years is treated as income for tax purpose.

net wealth till 1970, thereafter any excess over 1.5 lakhs is added to net wealth. The tax rates have been increased since 1957. The present rate of tax (1971-72) rises from 1 per cent on the first slab of wealth of Rs. 1 lakh (Rs. 2 lakhs in the case of Hindu undivided families) to 8 per cent on slabs of wealth exceeding Rs. 20 lakhs. There is an additional wealth tax on urban property exceeding Rs. 5 lakhs in value. The first taxable slab of Rs. 5 lakhs is taxed at 5 per cent and the balance at 7 per cent. The revenue from wealth tax has increased from R 8.15 crores in 1960-61 to Rs. 30 crores in 1971-72 (Budget).

Prior to the reform in company taxation, corporate incomes were subject to an income tax and a corporation tax (known as super tax on companies) and neither was allowed as a deduction in computing the other tax. In the case of profits distributed as dividends each shareholder was given in his assessment a credit for the amount of income tax (but not the super tax on companies) paid by the company that was attributable to the dividend received by him. This process of increasing the dividend income of a share-holder by the amount of income tax paid by the company on that part of its income, was known as 'grossing'. Thus, on profits distributed as dividends, the company was supposed to have paid the income tax on behalf of its share-holders. The 'grossing' process involved several complications. The share-holder was given credit at the average rate of income tax paid by the company and it was, therefore, necessary to find out how much of the dividend came out of taxed profits and how much, if any, out of profits exempt from income tax, and whether any part of it was paid out of profits of earlier years, which may have been taxed at different rates. These calculations involved delay in the assessment of share-holders, specially if they received dividends from several companies. The budget for 1959-60 abolished this 'grossing' process. As a part of the scheme of a simplification of company taxation, the wealth tax on companies and the excess dividends tax were abolished, though the tax on bonus shares was retained. It was levied at the rate of 30 per cent. The rate of the tax was reduced to 12½ per cent from April 1, 1961. The Finance Act, 1966 abolished the tax with a view to encourage the ploughing back of profits which may later be capitalized. Bonus shares were not taxable in the hands of the share-holders\*.

Under the new scheme, companies deduct income tax, which is deposited by them with the Government, at a flat rate (at present 23 per cent) from dividends paid by them and credit for this is given to share-holders in their assessments. Thereafter, corporate profits were, strictly speaking, subject to a single non-refundable tax. No part of it was

---

\*The concession was withdrawn from April 1, 1964, except in the case of bonus shares issued wholly out of share premium account.

paid on behalf of the share-holders of a company. The annual Finance Act, however, continued till 1964 the fiction of an income tax and a super tax on companies. Both were really a corporation tax and were so treated by the Government. From 1965, the annual Finance Act speaks of an income tax on companies. The terminology is misleading as under the Constitution, taxes on income (other than agricultural income) are shared with the States, while the corporation tax is assigned exclusively to the Union Government. While the Government of India treats the income tax on companies as a corporation tax, it is desirable (perhaps necessary) that the annual Finance Act should use the term corporation tax instead of income-tax on companies. An important effect of the new scheme has been the shrinkage of the divisible pool of income tax, which is not shared with the States. The reform in the scheme of company taxation was intended to simplify the taxation of corporate profits, but the Government of India used it to increase revenue also. The yield from the corporation tax has increased more rapidly than from the income tax. The corporation tax is levied at the rate of 55 per cent\* on the profits of Indian companies. The rate of tax is 70 per cent\*\* in the case of foreign companies as their share-holders are not assessed to taxes on income.

In 1963, an additional Super Profit Tax was imposed on the corporate sector at 50 per cent on residual income (that is, after payment of corporation tax) that exceeded 6 per cent of the paid up capital and reserves. The rate of tax was 60 per cent on that part of residual income which exceeded 10 per cent of the paid up capital and reserves. Subject to certain conditions, 10 per cent of residual income was exempt from tax.

The Super Profit Tax proved unpopular because, among other things, of the uneven nature of its effect on industry as a whole. To some extent, it affected industrial growth. Accordingly, the Super Profit Tax Act was suspended from April 1, 1964, and in its place a surtax was levied. The Act was repealed with effect from April 1, 1966.

The Company (Profits) Surtax Act, 1964 imposed a new tax in place of the Super Profit Tax. The new Act provided for lower tax rates, a larger standard deduction and a wider capital base. The surtax is applicable on corporate income from all sources, after deducting income and super tax payable on it that exceeds 10 per cent of the capital base or Rs. 2 lakhs, whichever is more. It was levied at a uniform rate of 40 per cent on the entire profits subject to surtax. The Act also provides for a rebate of 20 per cent of the surtax on profits derived from certain basic and

---

\*If the income does not exceed Rs. 50,000, the rate of tax is 45 per cent. The rate of tax in the case of private limited companies is 65 per cent, but in the case of industrial companies the tax is levied at 55 per cent on the first Rs. 10 lakhs of income and at 60 per cent on the excess.

\*\*This is the rate at which most taxable corporate profits are taxed.

capital intensive industries that have relatively low profitability and longer gestation period. These are given in the Third Schedule to the Act and include, amongst others, iron and steel, aluminium, copper, coal, cement, paper and pulp, tea, coffee and rubber, generation and distribution of electricity, etc. The finance Act, 1966 reduced the rate of surtax to 35 per cent. In view of the fact that the Finance Act, 1966 provided for a deduction of 8 per cent of the profits derived by a company from priority industries in the computation of their total income, the provision of 20 per cent rebate of surtax to these industries was deleted. The Finance Act, 1968 reduced the rate of surtax to 25 per cent with effect from the assessment year 1969-70. The rate of surtax was increased to 30 per cent on chargeable profits for the corporate sector that are in excess of 15 per cent of capital with effect from the assessment year 1972-73 (that is, with respect to the financial year 1971-72).

The income of the non-corporate sector was subject to two taxes, income tax and the super taxes,\* and neither was allowed as a rebate computing the tax liability under the other. In accordance with the constitutional provision, agricultural income\*\* is exempt from these taxes and this introduces great inequity in the tax system. In order to simplify tax calculation, the super tax was merged with the income tax in 1965 when a new rate schedule was prescribed. The tax rates have since been increased and are at present as under (the assessment year 1971-72):

|                                                                             |                                                                                        |
|-----------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| 1. Where the total income does not exceed Rs. 5,000                         | Nil                                                                                    |
| 2. Where the total income exceeds Rs. 5,000 but does not exceed Rs. 10,000  | 10 per cent of the amount by which the total income exceeds Rs. 5,000.                 |
| 3. Where the total income exceeds Rs. 10,000 but does not exceed Rs. 15,000 | Rs. 500 plus 17 per cent of the amount by which the total income exceeds Rs. 10,000.   |
| 4. Where the total income exceeds Rs. 15,000 but does not exceed Rs. 20,000 | Rs. 1,350 plus 23 per cent of the amount by which the total income exceeds Rs. 15,000. |
| 5. Where the total income exceeds Rs. 20,000 but does not exceed Rs. 25,000 | Rs. 2,500 plus 30 per cent of the amount by which the total income exceeds Rs. 20,000. |
| 6. Where the total income exceeds Rs. 25,000 but does not exceed Rs. 30,000 | Rs. 4,000 plus 40 per cent of the amount by which the total income exceeds Rs. 25,000. |

\*The rate structure of both these taxes for all slabs of income has been revised upwards several times in recent years. The 1939, the combined maximum rate of both these taxes was 9½ annas in the rupee (that is, 59.37 per cent) on slabs of income exceeding Rs. 5 lakhs. In 1947, the combined maximum rate of both these taxes was raised to 15½ annas per rupee (that is, 96.875 per cent) on slabs of income exceeding Rs. 1.2 lakhs of unearned incomes and 11s. 1.5 lakhs of earned incomes.

\*\*Agricultural income can be taxed by the States and is subject to a separate tax in several States. The tax rates are relatively less severe. Further, it is a great advantage, under a progressive rate schedule, to have income split into two different categories subject to two different taxes.

|                                                                                  |                                                                                             |
|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| 7. Where the total income exceeds Rs. 30,000 but does not exceed Rs. 40,000      | Rs. 6,000 plus 50 per cent of the amount by which the total income exceeds Rs. 30,000.      |
| 8. Where the total income exceeds Rs. 40,000 but does not exceed Rs. 60,000      | Rs. 11,000 plus 60 per cent of the amount by which the total income exceeds Rs. 40,000      |
| 9. Where the total income exceeds Rs. 60,000 but does not exceed Rs. 80,000      | Rs. 23,000 plus 70 per cent of the amount by which the total income exceeds Rs. 60,000.     |
| 10. Where the total income exceeds Rs. 80,000 but does not exceed Rs. 1,00,000   | Rs. 37,000 plus 75 per cent of the amount by which the total income exceeds Rs. 80,000.     |
| 11. Where the total income exceeds Rs. 1,00,000 but does not exceed Rs. 2,00,000 | Rs. 52,000 plus 80 per cent of the amount by which the total income exceeds Rs. 1,00,000.   |
| 12. Where the total income exceeds Rs. 2,00,000                                  | Rs. 1,32,000 plus 85 per cent of the amount by which the total income exceeds Rs. 2,00,000. |

The rates of tax are different for co-operative societies, registered firms (that is, those firms which are registered with the Income Tax Department), business carried on by local authorities and companies. The income of charitable, religious and approved scientific research institutions is exempt from tax. From 1961 the income of approved sports associations that satisfy certain specified conditions is also exempt from tax.

In addition to the above rates of tax, there is a central surcharge of 10 per cent of the total tax. The rate of the surcharge was increased to 15 per cent of the tax with effect from the assessment year 1972-73 in the case of income exceeding Rs. 15,000.

The present income tax exemption limit is Rs. 5,000 (assessment year 1971-72) for individuals and Rs. 7,000 for Hindu undivided families. Earlier, the exemption limit was Rs. 2,000, but it was reduced to Rs. 1,000 by emergency budget of September 1931. The budget for 1936-37 again raised the limit to Rs. 2,000. However, the exemption limit was again reduced to Rs. 1,500 in the budget for 1942-43. The exemption limit was raised to Rs. 2,000 in the budget for 1944-45 and to Rs. 2,500 by the Finance Act of 1947. In 1948-49 the exemption limit was further raised to Rs. 3,000. The Finance Act of 1950 raised the exemption limit to Rs. 3,600 for individuals and to Rs. 7,200 for Hindu undivided families. These limits were raised to Rs. 4,200 and Rs. 8,400 in the budget for 1963-64. However, in 1957, these limits were reduced to Rs. 3,000 and Rs. 6,000 respectively. In 1966, to give relief to low income groups, the limits were increased to Rs. 3,500 and Rs. 6,500 respectively. Subsequently, the Finance Minister announced on April 29, 1966 to further increase these limits to Rs. 4,000 and Rs. 7,000 respectively. The exemption limit for individuals was raised to Rs. 5,000 with effect

from the assessment year 1971-72 (that is, for incomes earned during the financial year 1970-71).

The rates of income tax are not laid down in the IncomeTax Act. They are prescribed every year by the Annual Finance Act. The result is, there are too frequent changes in the rates of tax.

There are certain incentives in the income tax scheme. Since 1948, donations made to approved charitable institutions are allowed a rebate of tax. At present, the maximum qualifying amount is 10 per cent of income or Rs. 2 lakhs, whichever is less. Corporate and non-corporate donors are allowed to deduct 50 per cent and 55 per cent respectively as the qualifying amount of the donations from their total income. After the Second World War, concessions were granted to provide incentives for investment. In 1946, the Finance Member introduced the grant of special initial depreciation allowances. These were replaced in 1955 by a development rebate, whereby a part of the cost of new plant and machinery is allowed as a deduction from income, without a corresponding reduction in its written down value for purposes of the depreciation allowance. The Finance Minister gave notice in May 1971 that the development rebate will not be allowed on new ships purchased or plants and machinery installed after May 31, 1974. He expected this advance notice to accelerate the rate of investment in the remaining years of the Fourth Plan.

In the case of priority industries (numbering 29, curtailed to 23, with effect from the assessment year 1972-73), 8 per cent (reduced to 5 per cent with effect from the assessment year 1973-72) of the profits are exempt from tax. As an incentive to savings and investment, payment of Life Insurance premiums and contributions to recognized Provident Funds and to Post-Office 10 and 15 years Cumulative Deposit Scheme are entitled to rebate of tax. However, only individuals are entitled to rebate on these postal deposits and not Hindu undivided families. The monetary limit for such qualified savings is 30 per cent of income subject to a maximum of Rs. 30,000 for Hindu undivided families and Rs. 15,000 in the case of individuals. With effect from the assessment year 1972-73, the qualifying limit for individuals was increased to Rs. 20,000. At present, 60 per cent of the first Rs. 5,000 of the qualifying savings plus 50 per cent of the balance is deducted from taxable income of the assessee. From the assessment year 1972-73, the whole of Rs. 1,000 of the qualifying saving plus 50 per cent of the next Rs. 4,000 plus 40 per cent of the remainder would be deducted from taxable income. Individuals and Hindu undivided families are also allowed to deduct upto Rs. 3,000 from their taxable income provided the income is from investments in Government securities, shares in Indian companies, units in the Unit Trust of India, deposits with banking companies, etc. Salaried persons are also allowed to deduct expenses of travelling to their place of work.

The deduction is Rs. 200 per month for those maintaining a car, Rs. 60 per month for those maintaining a motor-cycle and scooter and Rs. 35\* per month for others.

All newly established undertakings enjoy a tax holiday for five years following the year in which they begin production, subject to a limit of 6 per cent of the capital employed. Dividends declared out of such profits are exempt from tax in the hands of share-holders whether individuals or companies. There is a rebate of tax on the excess of production over the past year, so also on exports. Foreign technicians, whose contract of service has been approved by the Government of India before the commencement of their service in India, enjoy tax concessions. To encourage scientific research in the country, expenditure incurred on it is deductible from taxable income. There are incentives for shifting industries from thickly populated areas. To encourage construction of new buildings, a deduction of Rs. 1,200 or the annual value of the building, whichever is less, is deducted from income for a period of three consecutive years from the completion of the building. There are enhanced depreciation allowances to encourage employers to construct housing accommodation for the benefit of their low paid employees. From 1964, the income derived from the business of livestock breeding or dairy farming, is exempt from tax for three years. There are tax concessions to new industrial undertakings mainly employing displaced persons from Pakistan and repatriates from Burma, Sri Lanka, Mozambique or any other foreign country notified by the Government of India. There are tax concessions also for encouraging tourism in the country.

Customs revenue has lost its predominant position. In 1938-39, it was the most important source of revenue, yielding Rs. 38.91 crores and forming 53.7 per cent of the total tax revenue collected by the Government of India. Most of the duties are *ad valorem*, so that the revenue fluctuates with price changes and changes in the value of imports. Since the Second World War, the rates of import duty have been frequently revised upwards to yield larger revenue. When new excise duties are imposed on indigenous commodities, equivalent import duties are levied on similar imported products so that the indigenous producer is not adversely affected. Similarly, every increase in excise duties is accompanied by a corresponding increase in countervailing import duties. Following devaluation of the rupee in September 1949 and again after the Korean War, the Government of India isolated the internal prices from the export markets by imposing new export duties and increasing the existing ones\*\*. Accordingly, the revenue from export duties shot up to

\*Increased to Rs. 75 and Rs. 50 respectively with effect from the assessment year 1972-73.

\*\*A similar policy was followed after the devaluation of the rupee in June 1966 and the revenue from export duties shot up to Rs. 130.42 crores in 1967-68.

Rs. 90.74 crores in 1951-52. The heavy decline in the revenue thereafter reflects the gradual disappearance of the gap between the external and internal prices of our important exports. Owing to the abolition of most of the export duties, the yield from them was Rs. 2.14 crores in 1965-66, which shows that they are not a dependable source of revenue.

The history of protective tariffs begins with the adoption of the policy of discriminating protection in 1923. Their relative contribution to the revenue from import duties fell from 41 per cent in 1926-27 to 15 per cent in 1936-37 and to 0.54 per cent in 1971-72 (Budget). The contribution of customs revenue to the total tax revenue collected by the Government of India has declined to 15.5 per cent in 1971-72 (Budget), which is a reflection of the growth and diversification of the industrial structure of the country and its balance of payments difficulties, which have necessitated a tight import control. In recent years, import duties have been used to encourage import substitution and to mop up excessive profits of importers. As the industrial development of the country progresses, they are likely to be relatively unimportant source of revenue. In the U.S.A., customs revenue formed 53 per cent of the federal tax revenue during 1901-10. This percentage has now declined to 1.

Union excise duties levied at the manufacturing or production stage, have now become the mainstay of federal revenues. Their growth also reflects that the country's industrial structure has grown impressively. They have developed during the last two decades. Due to pressure from Lancashire an excise duty on cotton yarn was imposed in 1894. It was changed into an excise on mill-made cloth in 1896 and was abolished in 1926. Of the present excises, the earliest on motor spirit was imposed in 1917 and on kerosene in 1922. In 1934, new excise duties were imposed on sugar, matches and steel ingots. A few new excises were levied during the Second World War. Their coverage has been extended since independence. The rates of duty have also been increased several times. These duties yielded Rs. 8.66 crores in 1938-39, forming 11.5 per cent of the total tax revenue collected by the Government of India. This percentage increased to 46.5 in 1960-61 and to 60.4 in 1971-72 (Budget). They are now imposed on more than hundred commodities. The recommendations of the Excise Reorganization Committee (1960-63) have helped to simplify the structure and administration of the Union excise duties.

To check evasion and to simplify the tax procedure, the State Governments agreed in 1957 to withdraw sales tax on mill-made textiles (cotton, rayon, artificial silk and woollen fabrics), sugar and tobacco (including manufactured tobacco) and in lieu of the sales tax the Government of India levied additional duties of excise on these commodities. Their net proceeds are distributed among the States. In view of the success of this measure, the trade has persistently demanded extension of the

scheme. The Union Government has also lent its influence to this demand. The State Governments have refused to proceed further in this direction as they fear loss of fiscal independence. However, they agreed to include silk fabrics in the scheme in 1961-62. The yield from the additional excise duties has increased from Rs. 33.60 crores in 1960-61 to Rs. 78.81 in 1971-72 (Budget).

The sales tax was first levied in 1939 in Tamil Nadu. It is now levied in all the States and is the most elastic and productive source of State taxation, yielding 50.2 per cent of the tax revenue collected by them in 1971-72 (Budget). It is, strictly speaking, not a general sales tax as some commodities are exempt from tax and some are taxed at higher rates. In several States, foodgrains are not taxed, while luxury articles are taxed at about 10 to 16 per cent. The structure of the tax, as also its rates, vary from State to State. Some States levy a single point tax, generally at 5 to 7 per cent, while others levy a multiple point tax at 0.5 to 3 per cent. Motor spirit is taxed separately in all the States\*. The Central Provinces was the first State to tax in 1938. West Bengal levies a purchase tax on raw jute, while Andhra Pradesh, Bihar, Maharashtra, Karnataka and Uttar Pradesh levy a cess on sugar-cane purchased by sugar mills. These taxes are levied on purchases as they are organized and are few in number.

Articles 286 of the Constitution imposed certain restrictions on the powers of the States to levy sales or purchase tax. These restrictions relate to sales or purchases made outside the State or in the course of import of the goods into, or export of the goods out of, the Indian Union. The former is intended to ensure freedom of inter-State trade and to prevent a State from taxing consumers in other States. The latter safeguards the power of the Union Government to tax imports and exports. The Article also prevents the States from levying a sales or purchase tax on any article declared by Parliament to be essential for the life of the community, unless such legislation received the assent of the President. The interpretation of Article 286 by the Supreme Court led to several difficulties. Accordingly, the Constitution was amended in 1956. As a result of the amendment, the Union Government acquired legislative powers to levy taxes on the sale or purchase of goods, where such a transaction takes place in the course of inter-State trade. Parliament was also given powers to formulate principles to determine when a sale or purchase takes place outside a State or in the course of import or export. Parliament also acquired authority to impose restrictions on the powers of the States to levy taxes on the sale or purchase of goods declared by it to be of special importance in inter-State trade or com-

---

\* Except Rajasthan, where the selective sales tax on motor spirit was merged with the general sales tax in March 1969.

merce. Following the Constitutional amendment, Parliament passed the Central Sales Tax Act (1957). It imposed a tax of 1 per cent (increased to 2 per cent with effect from April 1, 1963 and 3 per cent with effect from July 1, 1966) on inter-State sales to registered dealers.

In the case of sales to unregistered dealers or consumers in other States the rate of tax, on goods not on special importance in inter-State trade, is 7 per cent\* or the rate on which the sale or purchase of such goods is taxed inside the exporting State, whichever is higher of the two. The Act declares some essential raw materials as goods of special importance for inter-State trade and commerce and imposes some restrictions on the powers of the States to levy taxes on the sale or purchase of such goods. Under the Act, the Government of the exporting States are authorized to assess and collect the tax. The tax proceeds are also retained by them and are included under general sales tax revenue\*\*.

The assessment of the Central Sales tax is done by the same State officials who assess the general sales tax.

Land revenue has lost its earlier importance and now yields only 6.3 per cent of the tax revenue collected by the States. This is chiefly due to the abolition of intermediaries in land. The yield has also increased due to the imposition of betterment levies and surcharges in several States. There is need to reform the structure of the tax. At present, it is levied on agricultural land at a flat rate on its net produce without any exemption limit. The levy varies with grades of land, as it is related to net produce. It has been a very inelastic source of revenue. Its percentage contribution to the total tax revenue of the Central and State Governments was 7.9 in 1950-51 and 2.0 in 1971-72 (Budget) as against 38.6 in 1900-01. Since the Second World War, the price of agricultural produce has greatly increased, but there has been hardly any increase in the land revenue assessment. The assessment is revised after a resettlement which involves a detailed survey of agricultural land and imposes heavy additional work on the district administration. Resettlement has not been possible in most States due to the pressure during Second World War and the growth of the development programme thereafter. Most of the new taxes are also borne by the non-agricultural sector. The agricultural sector has, therefore, greatly improved its relative position. Studies made about the incidence of taxation by the Taxation Enquiry Commission for 1953-54 and the Department of Economic Affairs, Ministry of Finance, for 1958-59 and 1963-64 show that the burden of taxation is relatively less, for all levels of income, on the rural sector of the economy. On the other hand, most of the development expenditure under the Plan is rural/agricultural

\*Increased to 10 per cent with effect from April 1, 1963.

\*\*The revenue from the Central Sales Tax was Rs. 150.04 crores in 1971-72 (Budget).

oriented. Thus public finance results in inequity between the agricultural and the non-agricultural sectors.

Prohibition has resulted in the loss of an annual revenue of about Rs. 100 crores from State excise duties. Complete prohibition has not been enforced in all the States due to revenue and administrative considerations. Some States introduced complete prohibition, some others introduced it in selected towns and areas, while some others have not introduced it in any area. Even non-prohibition States have schemes of reducing the consumption of liquor and intoxicating drugs. The free sale of opium, is, however, prohibited in all the States. State excise duties are levied on the production and sale of alcoholic drinks and intoxicating drugs. The rates of excise duties on these commodities vary from State to State. The drink habit is generally confined to industrial workers and members of some backward communities. The incidence of tax, therefore, falls mostly on the poorer classes and prohibition can be viewed as a fiscal reform. These excise duties have always been levied for regulating the consumption of liquor and the aim has been to raise maximum revenue while trying to maintain consumption at as low a level as possible. These duties yielded a revenue of Rs. 208.59 crores in 1971-72 (Budget) as against Rs. 47.34 crores in 1950-51. Prohibition has greatly increased smuggling and illicit distillation\*.

Stamp duty includes the revenue from court fees and probate duties on letters of administration and succession certificates. It also includes the revenue from non-judicial stamps affixed on instruments relating to transfer of property or other commercial transactions. The rate of duty varies from State to State except in the case of documents where the rates are fixed by the Union Government. In the case of some documents, the duty is *ad valorem*, while on others it is, a fixed sum. It is difficult to determine the incidence of stamp duty as also of court fees. Their rates have been increased frequently to raise more revenue. The registration revenue consists of fees levied on the registration of documents, a permanent record of which is maintained by the Government. These fees are different in different States.

Motor vehicles taxes are levied in all the states for registration and transfer of ownership of motor vehicles and for issuing licences for driving such vehicles. These taxes were originally levied for regulatory purposes, but are now a source of revenue. The revenue from them has increased almost thirteen times since 1950-51. The Motor Vehicle Taxation Enquiry Committee (1950) recommended that, "a licence granted in one State should be valid, if an endorsement to travel in another State is granted, without the payment of further taxes." Most States

---

\* Madras (Tamil Nadu), which was the first State to enforce prohibition, reopened the dry law with effect from August 30, 1971. Some other States have also partially retraced their steps.

levy fees or taxes on the entry of passenger and transport buses registered in other States. This creates a barrier to inter-State transport as buses are discouraged to play on inter-State routes.

Electricity duties are recovered from electric supply companies, who collect them from their consumers. Usually industrial consumers are taxed at a lower rate. The tax does not hit the poor people, who usually use kerosene for lighting their houses. Bombay was the first State to levy the tax in 1932. It is now levied in all the States except Assam and Jammu and Kashmir. The entertainment tax is levied in all the States on the value of tickets to places of entertainment. Entertainments of a wholly educational character or for the advancement of agriculture, industry or public health are generally exempt from tax. The tax is also not levied if the entire proceeds are earmarked for charitable or philanthropic purposes.

The urban immovable property tax is levied in Gujarat, Haryana, Jammu and Kashmir, Kerala, Madhya Pradesh, Maharashtra, Karnataka, Punjab, Tamil Nadu and West Bengal.

## XII. Public Debt Policies and Programme

The origin of the public debt in India dates from the French wars in the South during the second half of the 18th century. The East India Company continuously financed its increasing military expenditure by borrowing. It raised loans for its commercial activities also. This debt was not kept separate since the Company regarded its Indian conquests as an income-yielding estate. Even after the separation of the Company's commercial and territorial accounts in 1819 certain items of expenditure definitely relating to the former were debited to the latter. Accordingly, the Company's debt increased to Rs. 63·6 crores. This debt, which was incurred to finance the commercial activities of the Company or to annex the territories of India and was thus part of the cost of acquiring the Empire, was treated as India's public debt when the Empire was acquired by the Crown. In addition, £12 million paid to the proprietors of the East India Company stock was also added to it. Most of the Company's debt was raised in India — only about 5 per cent of it was sterling debt. Originally, even the India debt was owned by the British, but by the end of the Company's rule about a third of it was held by Indians.

The Company hardly borrowed for productive purposes. In 1867-68 the Government of India began to raise loans for irrigation works and in 1870 this policy was extended for constructing railways by the Government itself. The Government of India also financed capital expenditure out of current revenues or budgetary surpluses and from the annual provision for famine insurance. The result was that the net excess of

debt over productive assets had declined to Rs. 33 crores by the end of March 1902 and to Rs. 3 crores by March 31, 1916. Thereafter, the unproductive debt increased on account of deficits on revenue account due to increased military expenditure\* and India's war contribution of £100 million.

So far only the Central Government had a right to raise market loans. Under the Government of India Act (1919), the Provincial Governments were allowed to raise loans on the security of their revenues subject to the sanction of the Governor-General in Council in the case of rupee loans and of the Secretary of State for India in the case of foreign loans. They could, however, borrow only for "any work or permanent asset of a material character in connection with a project of lasting public utility" provided the expenditure was too large to be met from current revenue. Loans could also be raised for famine relief and the Provincial Loan Account subject to certain conditions. Till the inauguration of Provincial Autonomy, Bombay, Uttar Pradesh and the Punjab took advantage of these powers to raise rupee loans. The Government of India Act (1935), authorized the provinces to raise foreign loans with the consent of the Central Government. Such consent was also necessary for internal loans in case a province owed any debt to the Government of India or in respect of which it had given a guarantee. The provincial balances were decentralized, though a part of them were adjusted against the loans outstanding to the Government of India. After cancelling, wholly or partly, the debt of some of the provinces, as special financial assistance to them the balance was repayable in semi-annual equated payments of interest and principal in 45 years. In future, the provinces were to meet their short-term requirements from the Reserve Bank of India or through the issue of Treasury Bills — a form of borrowing commenced by them in 1938-39.

Under the Indian Constitution, the States are prohibited from borrowing abroad in order to give complete control of foreign affairs to the Union Government. A State can borrow within India upon the security of its Consolidated Fund. However, it has to obtain the consent of the Government of India if it owes a debt to it or for which it has given guarantee. The Reserve Bank of India manages the debt operations of the Union and State Governments and co-ordinates their borrowing programmes. All the States are indebted to the Union Government and have, therefore, to obtain its consent to raise market loans. This consent may be given subject to such conditions as the Union Government may deem fit to impose. This provision helps in fixing the timing and volume of State loans and avoids competition.

---

\*During the First World War, India had to meet an expenditure of about Rs. 87.5 crores for Imperial purposes.

Throughout the British regime, the Government followed a conservative public debt policy. It never borrowed to finance non-revenue yielding social and development expenditure. Even productive capital expenditure was at times financed out of current revenue so that at the end of 1938-39 against interest bearing obligations of Rs. 1,205.76 crores the Government of India held interest yielding assets of Rs. 946.38 crores, and 30.30 crores in cash and securities on Treasury account, so that the uncovered part was Rs. 229.08 crores. Even this was due to the heavy expenditure thrust on India by Imperialist wars and the war contribution of £ 100 million. For the first time, a sinking fund was established for the 5 per cent War Loan of 1917. In December 1924, at the initiative of the Finance Member, Sir Basil Blackett, the Central Assembly accepted a definite scheme of sinking fund. Since then, an annual provision is made in the revenue budget for 'reduction or avoidance of debt'. Since 1945-46 this provision has been Rs. 5 crores. This annual provision was discontinued from 1970-71 in consultation with the Comptroller and Auditor-General.

The Government of India financed the Second World War mainly on a 3 per cent basis, although in pursuance of the cheap money policy it progressively improved the terms of borrowing through a reduction in the rate of interest or an increase in the period of maturity or a rise in the issue price of loans. Its public debt policy failed to raise adequate funds to meet its own requirements as also the Allied expenditure, including recoverable war expenditure\*, incurred in India. The rupee obligations of the Government of India increased from Rs. 736.64 crores on March 31, 1939 to Rs. 2,245.10 crores on March 31, 1946.\*\* During the same period, its budgetary deficits were Rs. 604.88 crores and capital outlay, outside the revenue account, Rs. 294.36 crores. Since its rupee incomings were far in excess of its own requirements, its cash balance increased from Rs. 13.14 crores to Rs. 529.53 crores. In spite of this, inflationary conditions developed in the country. The Reserve Bank of India provided rupees against sterling to finance Allied expenditure in India and this became a source of weakness to the rupee. The issue of currency depended on the rupee requirements of the Allied Governments. It resulted in an accumulation of blocked sterling balances and an increase in currency circulation that led to a fall in the international purchasing power of the rupee. This amounted to a compulsory loan to the British Government. During the war, this arrangement was anti-inflationary for the British economy. Further, while the Government

---

\*During the period 1939-40 to 1946-47, the total recoverable war expenditure was Rs. 1,791.35 crores.

\*\*During the same period, the interest bearing obligations in England declined from Rs. 469.12 to Rs. 63.38 crores.

of India borrowed at about 3 per cent, the sterling balances earned a meager  $\frac{1}{2}$  per cent or so as they were invested in the U.K. Treasury Bills. This was an additional burden imposed on India. However, the Government of India repatriated its sterling debt and made advance payments for its sterling liabilities on account of railway annuities, pensions, provident funds, etc. The Government paid an average of 3.36 per cent on its sterling debt, whereas the sterling balances, used to repatriate this debt, earned much less.

Since independence, there has been no change in the importance of rising internal loans. The Government is committed to a large development programme and its success in raising loans reduces dependence on deficit financing. It has also tried to raise large loans from I.B.R.D. (International Bank for Reconstruction and Development, also known as the World Bank) and friendly foreign countries to finance the foreign exchange component of the development programme. The response to the Government's internal borrowing programme has, however, been poor. There was a net outgo on permanent debt account, the outstanding rupee loans having declined in March 1956 as compared to March, 1948. The response has since been better. During the five years ending March 1963, net realizations from rupee loans were Rs. 859.39 crores and from unfunded debt, which includes provident fund receipts and Postal deposits, Rs. 961.98 crores. During the five years ending 1971-72 (Budget), the net increase in the permanent rupee debit of the Government of India was Rs. 994.58, in the floating debt (including Treasury Bills) was Rs. 817.48 crores, in the unfunded debt (including small savings schemes Rs. 682.36 crores) Rs. 1,125.21 crores and in the reserve funds and deposits Rs. 550.45 crores. Owing to the insufficiency of loans finance, the Government of India had large deficits in its capital budget. Consequently, despite surpluses on revenue account there have been overall deficits. These have been financed through the sale of Treasury Bills to the Reserve Bank of India, resulting in expansion of currency and rise in prices. Since independence, the terms of borrowing have progressively been against the Government, which allowed the dried up springs of loanable funds to revive and did not increase the rate of interest beyond 3 per cent till 1953, though better terms were offered. The effective rate of interest, however, increased due to a fall in the price of Government loans. For instance, the market price of 3 per cent Rupee Paper fell from Rs. 97.88 in March 1948 to Rs. 92.69 in October 1951, yielding a return of 3.24 per cent. The Government of India had to offer  $3\frac{1}{2}$  per cent interest on National Plan Bonds, 1961 issued at Rs. 98.25 in June 1953. The terms of borrowing have since become more adverse. In November 1962, a medium-dated loan repayable in 1972 was offered at

4½ per cent, while a long-dated loan repayable in 1985 was issued in July 1962 at 4½ per cent. The Government also increased the rate of interest on Post-Office Savings Bank deposits to 3 per cent in August 1962. The rates of return on other forms of Postal deposits were also increased. The rate of interest was further increased when in July 1964 the Government of India issued a 25 year loan at 5½ per cent. With effect from April 1, 1965 the interest on Post-Office Savings Bank deposits was increased to 4 per cent. Similar increases were effected on other forms of Postal deposits also. The rate of interest on fresh loans was further increased in 1971, when in June 1971, and October 1971 the Government of India issued the short-dated loan 1978 at 4.75 per cent, the medium-dated loan 1986 at 5.25 per cent and the long-dated loan 2001 at 5.75 per cent (all at par)

The rupee and foreign debt liabilities of the Government of India have increased rapidly since independence and this in turn has increased the the Government's interest bill. In this connection, it is relevant to examine the maturity pattern of the Government of India loans. Of the total rupee loans\*, 40.8 per cent mature within 5 years and another 14.6 per cent within a further period of 5 years. Only 38.3 per cent mature after 10 years and the remaining 6.3 per cent are undated loans. Most of the debt liabilities are covered by assets. The development grants to the States have also resulted in material assets. The Government owns museums, research laboratories, buildings and other properties as well.

The States are increasingly dependent on the Centre even for loan finance. Their debt has increased rapidly, though most of it is covered by remunerative capital assets.

### **XIII. Financial Organization and Controls**

The Government of India did not have a separate finance department till 1843. The post of a Financial Member of the Governor-General's Council was created in 1859. The origin of the budget system dates from February 19, 1860 when the first Finance Member, Sir James Wilson, presented his budget to the Legislative Council. The Indian Councils Act of 1892 granted to the Legislative Council the right to discuss the budget. From 1871-72, the provinces had separate budgets, which were appended to the Central budget. They were entirely separated under the Reforms of 1919 and from 1921-22 provincial transactions were not included in the Central budget. Popular control, except on expenditure charged on the revenue, was extended under Provincial Autonomy in 1937, when the Provincial Governments became res-

---

\*As at the end of March 1970.

possible to their legislatures. The Governor could restore any cut, if in his considered opinion, was essential for the discharge of his special responsibilities. At the Centre, the expenditure on defence, external and ecclesiastical affairs, tribal areas, etc. was non-votable and the Governor-General had powers to restore any cut, if necessary, for the discharge of his special responsibilities, which were much wider than those of the Governors. Since the abolition of the Company's rule in 1858, the Governor-General was under the overall control of the Secretary of State for India, who was responsible to the British Parliament.

Under the Constitution, adopted in 1950, an 'annual financial statement' or the budget has\* to be placed before both Houses of Parliament. It has to distinguish transactions relating to the Consolidated Fund from those relating to the Public Account. All revenues, loans etc., received by the Government are credited to the Consolidated Fund, while the Public Account contains transactions of a banking nature and withdrawals therefrom do not require the sanction of Parliament. The statement has also to distinguish expenditure on revenue account from capital expenditure and so, in fact, there is provision for a capital budget distinct from the revenue budget. No money can be withdrawn from the Consolidated Fund except on the sanction of Parliament. However, the following expenditure is charged on the Consolidated Fund: (a) servicing of the public debt, (b) salaries and allowances of the President and the expenditure of his office, (c) salaries and allowances of the Speaker and Deputy Speaker of the Lok Sabha (the Lower House) and of the Chairman and Deputy Chairman of the Rajya Sabha (the Upper House), (d) salaries etc., of the Judges of the Supreme Court and the Comptroller and Auditor-General and the expenses of his office, (e) privy purses\*\* of the former Princely Rulers, etc. There are similar provisions in the Constitution with respect to the States.

The Constitution provides that no tax can be 'levied or collected except by authority of law'. A money bill can only be introduced in the Lower House on the recommendation of the President or the Governor as the case may be. This makes the Ministry solely responsible for taxation and expenditure. The legislature cannot force it to spend more though it can reduce or reject a demand for grant. The budget speech of the Finance Minister contains all the new financial proposals of the Ministry and evokes great public interest, as they will certainly be enacted by the legislature, unless the Ministry agrees to modify them. This is possible as the Ministry enjoys the support of the legislature, otherwise a new

---

\*The Central budget is presented on the last day of February. The Railway budget is presented separately before the general budget, which incorporates these figures in lumpsum.

\*\*The Government of India has since abolished the privy purses and privileges of the former Princely Rulers.

Ministry will be formed. Yet the control of the legislature is supreme as nothing can be raised or spent except through its sanction. For unforeseen emergencies, there is a Contingency Fund from which the Government can incur expenditure pending sanction of the legislature. The Contingency Fund is recouped through supplementary demands for grants. Thus the Ministry has not to run to the legislature every time it has to incur expenditure not provided in the original estimates. The device of supplementary grants may, however, encourage careless budgeting. The estimates of expenditure are presented to the Lower House in the form of Demands for Grants, except for such expenditure as is 'charged' on the Consolidated Fund. After the demands have been voted, the money required to meet them as also for 'charged' expenditure is withdrawn on the authority of an Appropriation Act passed annually by the legislature. As this takes time, the legislature appropriates, at the beginning of each financial year, some funds for the interim period through a 'Vote on Account'. A separate Finance Act is passed incorporating the tax proposals of the budget. The Government has authority to meet excess expenditure under one sub-head of a demand from savings under another sub-head, provided it is within the total demand except that savings in 'charged' expenditure cannot be utilized for excess expenditure under 'voted' heads.

To ensure that the wishes of the legislature are carried out, there is provision for independent audit. The terms of appointment of the Comptroller and Auditor-General, who is appointed by the President, cannot be varied during his tenure. His emoluments and the expenses of his office are charges on the Consolidated Fund. After he ceases to hold office, he is ineligible to hold any paid office under the Union or State Governments. Thus, his independence is complete and he has to seek no favour from the Government. Audit is a federal responsibility and this ensures uniformity in the maintenance of accounts in accordance with the standard classification laid down in the All India List of Major and Minor Heads of Account, published by the Comptroller and Auditor-General. The Government accounts represent the actual cash receipt and disbursements during the financial year ending March 31, when any unspent grants lapse and fresh sanction is necessary. Before 1867, the financial year ended on April 30, so that the accounts for 1866-67 relate to 11 months only. Prior to financial integration the Princely States had different financial years. Their accounting classifications were also different.

The Union and State legislatures have two committees, composed of their members, who act as watch-dogs over the financial transactions of the executive. The Public Accounts Committee conduct a *post-mortem* examination of the accounts, after they have been audited to ensure that the wishes of the legislature have been carried out. It also detects

frauds or irregularities, malpractices and misappropriations. The Estimates Committee scrutinizes demands to recommend economies in carrying out policies approved by the legislature. It usually studies thoroughly the working of a few Ministries each year and goes into considerable details to scrutinize expenditure. Both the Committees make searching enquiries and have been doing very useful work.

The British in India followed an orthodox budgetary policy. During the depression of the thirties, the Government increased taxes and drastically reduced expenditure to achieve budgetary balance. A welcome change was noticeable during the Second World War. Today, the budget is an important policy instrument and fiscal policy is a tool for achieving the social and economic objectives of the nation. The annual budget is accordingly framed in the light of the existing situation, which is reviewed in the budget speech of the Union Finance Minister. *The Economic Survey*, circulated to Parliament shortly before the Union budget, reviews the economic situation in greater detail. The State Governments also frame their budgets in the light of the prevailing circumstances and the objectives to be achieved. Uniformity in fiscal policy is achieved through the National Development Council, consisting of the Chief Ministers of all the States and presided over by the Prime Minister of India. There are also conferences of Union and State Finance Ministers. The Planning Commission and the Five Year Plans also help to bring about uniformity in policy. Finally, the increasing dependence of the States on the flow of funds from the Union Government ensures a co-ordinated fiscal policy.

## CHAPTER XIV

# EXTERNAL RESOURCES

### I. The Role of External Resources

No economy is self-sufficient. Every country needs to import certain things from outside and it has to export in order to pay for them if it has no aid or accumulated balances abroad. Imports and exports, in their widest sense, include not only merchandise but also services, the so-called "invisible" items in internal trade, such as, transportation, banking and insurance facilities, as well as technology and know-how. Rarely does it happen that all that a country is currently importing is exactly balanced by what the country is exporting. In any given period of time, there is either a surplus on current account in a country's international payments, or a deficit. Whenever a country has a deficit, it needs external resources with which to cover it.

Most countries maintain a certain reserve, usually in the shape of gold or internationally acceptable foreign currencies, out of which temporary deficits are met and to which temporary surpluses are credited. Such reserves, by their very nature, can only help to tide over short-term fluctuations in trade, but are no answer to a situation in which a country suffers a chronic deficit year after year in its external trade. Such a country must either be able to borrow abroad, or it must take steps to curtail the excess of its imports over exports.

The need to borrow abroad or to obtain external resources can thus be said to arise when a country's exports are not sufficient to pay for its imports over the years. One must, however, go a little deeper and ask in what conditions such a situation can develop and those in which reliance on loans or capital from outside can be said to be justified. A country can well get into a chronically deficit position in its international trading by being extravagant in the sense that it consumes more than it produces, or by indulging in large unproductive expenditure on armaments. To rely on borrowing abroad in such contingencies is only to postpone the evil day. Sooner or later, the debts have to be repaid and if the economy has not gathered any strength, if it is not developing new lines of export, or industries, which will reduce its requirements of imports, then, in the end, it would be the worse off for the loans it has incurred. On the other hand, if the deficit in current trade is a reflection of increased investment in productive enterprises, investment which cannot be matched for the time being by domestic savings, then the country may well find it to its long-term advantage to borrow abroad with the confidence that as its economy develops, it can not only repay

what it has borrowed, but has secured for itself a higher level of national income in the process. Thus the richest nations today — countries like the United States — have, in the past, relied heavily on external resources, the inflow of capital from abroad, during the decades when they were developing rapidly and their own internal resources, their domestic capital formation, were inadequate.

One of the most important problems, both politically and economically, before the world today is that a large number of countries, which have after centuries of foreign domination emerged as independent nations, cannot afford anything but an intolerably low standard of living out of their own resources and need external help in order to develop. Perhaps, the most important single factor limiting development in these countries is the shortage of capital. When per capita incomes are low, only a small proportion of the national income can be saved and, therefore, a rate of investment sufficient to secure a satisfactory growth rate cannot be attained without additional resources being made available from abroad.

There is another way of looking at the same situation. The process of development requires many kinds of goods, particularly plant and machinery which are not produced in under-developed countries or, at any rate, not in any adequate quantities. As the rate of investment increases, the demand for power and transport equipment and other kinds of machinery rises so substantially that it has to be met only from a significant increase in imports. This increase is usually of such magnitude that it can be financed only if external resources are available. Indeed, even if domestic savings could be stepped up substantially to match the level of aggregate investment, the process of development may engender an imbalance in trade for the simple reason that developmental goods are not being produced in adequate quantities to meet the requirements, and new lines of exports to pay for their imports cannot be developed until the economy itself has been diversified. In other words, a developing country, which has the domestic capital for investment but not the capital goods which it needs, may also face a situation in which imports increase in the developmental phase and thus be in need of external resources. In actual fact, practically all developing countries are short both of indigenous capital and of indigenous capital goods. Their efforts to step up the level of domestic investment engender a demand not only for capital goods but also a wide variety of other things. Thus, when a factory is being set up, the employment created results in increased requirements of food, clothing and shelter on the part of labour which may in turn lead directly or indirectly to higher imports. Whichever way we look at it, there is no gainsaying the fact that when an under-developed country tries to build up its economy, it needs a great deal of additional external resources; it is only after the

process of development has reached a certain stage, when domestic savings are adequate and domestic production has been diversified, that the economy can continue to develop at a reasonable pace even without external resources.

Ways have, therefore, to be found for the transfer of resources from countries which have already attained a high standard of living and have a surplus of capital to the developing countries of the world. This transfer can take place through the initiative of private investors, who would expect a better return on their investment in an area where there is a tremendous shortage of capital than in places where it is in abundance. In actual fact, however, it is becoming increasingly clear that the scale of private investment in developing countries is not likely to meet their needs at least for quite some time to come. There are many reasons for this. The rate of growth in the developed countries themselves is pretty fast and has gathered a new momentum in recent years. Much of the private capital available for investment can, therefore, be usefully and profitably employed in the developed countries themselves without venturing farther afield into what looks like more risky terrain. Another connected problem lies in the fact that private capital must normally expect a return fairly soon. It may, however, happen that while the project in which the investment has been made is profitable, the remittance of the profits outside the country may tend to aggravate the gap in the balance of payments from which developing countries as a rule suffer, unless the production which flows from the investment directly and immediately contributes to a saving of foreign exchange. For these and various other reasons, it has come to be recognized that there is need to organize official assistance on an international or bilateral basis to provide the external resources which developing countries need.

We have now to turn from these somewhat general considerations to the specific role of external resources in the Indian economy. There has been a radical change in the basic factors affecting the situation with the conscious and deliberate effort for the planned development of the Indian economy after independence. It would, therefore, be desirable to make a review of the period before independence separately from the later and more recent developments.

India today is engaged in an effort to reach a stage of self-sustaining growth. By this is meant the achievement of a certain level of development beyond which further growth of the economy will cease to be dependent on external resources. For this, two things would seem necessary in the light of what has been explained above. First, the level of domestic savings has to be raised to sustain an adequate level of investment. It is important to realize that unless the level of investment is high enough to result in a rate of growth which will outpace the increase in population, the economy as a whole will not be moving for-

ward. Considering the state of poverty and the generally low levels of income, the prospect of domestic savings being adequate is itself dependent upon accelerating the present rate of growth with external resources. The second factor which is important is an increase in the domestic production of those things which contribute to higher rates of growth e.g., plant and machinery, as well as things like fertilizers which help in increasing agricultural production.

Before considering the way in which external resources are being deployed towards the objective of what is popularly known as "economic take off", it would be useful to look at the past so as to see the problem in its historical perspective. Unfortunately, adequate and reliable data are not available. While trade statistics exist for the whole of the country — and it is unnecessary to go earlier than that — figures about invisibles are both scarce and unreliable.

The lack of consistent and authentic statistics is naturally more pronounced before the First World War. However, on the basis of such information as is available, it is clear that there was consistently some inflow of capital into the country as reflected in the estimated current account deficits in the balance of payments. One must also consider two other things: first, that although authentic figures of foreign exchange reserves are naturally not available for the period until the Reserve Bank of India began to keep custody of reserves and to publish figures regarding them, it seems likely that there was no sizeable accretion to reserves from year to year and secondly, that in fact it is common knowledge that there was considerable foreign investment in certain sectors, such as, the railways and other utilities as well as the plantations. These factors taken together with the estimated current deficits lend support to the belief that even during the period preceding the First World War, there must have been some steady inflow of private foreign capital into the country. While the actual magnitudes of such inflow may be debatable, the broad trend is probably unmistakable.

## II. External Resources Before Independence

The need for and the role of external resources in India's economy prior to independence were different from what they are now. Since planning began, the need for external resources has been steadily rising for reasons to be discussed later. In the pre-independence days, India almost always ran a surplus in her overall merchandise trade account (excluding treasure) which had averaged a little under Rs. 100 crores per year in the ten years preceding the Great Depression, but which fell to an annual average of about Rs. 70 crores during 1930-33\* and further

---

\*Actually, in the worst Depression year 1932-33, the country's trade surplus had fallen to a distressingly low level of under Rs. 6 crores.

to Rs. 30 crores during the next three years 1933-36. After that there was a gradual recovery. In any event, there was no trade deficit to be financed by external resources.

**Brief Review of India's Pre-War Balance of Payments:** Statistics of India's balance of payments are not available prior to the First World War. Even when the required statistics are collected, estimated and put together, the result seriously falls short of the degree of sophistication which goes into a modern presentation of the balance of payments on the pattern laid down by the International Monetary Fund.

**1901-1914:** An effort to estimate the balance of payments of the country in the years preceding the First World War was made by Y. S. Pandit.\* According to Pandit, while India generally ran a surplus in her merchandise trade account, in the current account of her overall balance of payments, there was, however, an average deficit of about Rs. 13 crores per year.

TABLE I  
India's Balance of Payments 1901-14\*\*

(Rs. lakhs)

| Year    | Merchandise Trade<br>Net Receipts | Invisibles<br>Net Payments | Total Current<br>Account (Net) |
|---------|-----------------------------------|----------------------------|--------------------------------|
| 1901-02 | 3,486                             | 4,823                      | -1,337                         |
| 1902-03 | 3,575                             | 4,152                      | -577                           |
| 1903-04 | 4,534                             | 4,713                      | -179                           |
| 1904-05 | 3,854                             | 5,044                      | -1,190                         |
| 1905-06 | 3,283                             | 5,780                      | -2,497                         |
| 1906-07 | 2,762                             | 3,791                      | -1,029                         |
| 1907-08 | 1,176                             | 3,844                      | -2,668                         |
| 1908-09 | 1,732                             | 3,160                      | -1,428                         |
| 1909-10 | 4,220                             | 6,685                      | -2,465                         |
| 1910-11 | 5,141                             | 5,869                      | -728                           |
| 1911-12 | 5,067                             | 5,632                      | -565                           |
| 1912-13 | 4,144                             | 4,679                      | -535                           |
| 1913-14 | 3,596                             | 5,427                      | -1,831                         |

The structure of India's balance of payments until the outbreak of the First World War is quite clear from the above; there was invariably a sizeable surplus on trade account, which was more than offset by net payments on account of invisible transactions, including service transactions as well as Home Charges.\*\*\* The important point which emerges

\*Y. S. Pandit — India's Balance of Indebtedness, 1898-1913, George Allen & Unwin Ltd., London, 1937.

\*\*Op. Cit., P. 103.

\*\*\*A minor portion of 'Home Charges' consisted of payments against purchases of Government stores in Great Britain, which should strictly form part of merchandise imports and not of the invisible account.

from the above figures, however, is that every year there was a current account deficit of about Rs. 13 crores which was financed by an equal inflow of foreign capital. Virtually all of this inflow of private capital was from Britain and was directed to the Railways and other utilities as well as some other sectors such as plantations, etc.

**1914 to 1939:** After 1913-14, there was a wide gap in our series of balance of payments upto 1921-22 and the picture is blurred, except for statistics of the trade balance. For the war years, the trade balance was as follows:

TABLE II  
India's Balance of Trade During First World War\*

| (Rs. crores) |         |         |         |         |
|--------------|---------|---------|---------|---------|
| 1914-15      | 1915-16 | 1916-17 | 1917-18 | 1918-19 |
| +3.8         | +6.2    | +5.5    | +5.4    | +4.4    |

It should, however, be added that the war generated forces which did not exist before and the country's external accounts were substantially transformed. Briefly, what happened was that foreign demand for India's exports, especially of jute bags for trench warfare, and for her other manufactures as well increased sharply while demand for imports remained fairly stagnant until after 1917. The increasing trade surplus meant that foreign demand for Indian rupees exceeded supply and exchange equilibrium had, therefore, to be maintained only by the sale of Council Bills on London, on a large scale, by the Secretary of State for India. This together with a continuous rise in the price of silver (of which rupee coins were made) made it difficult to peg the rupee-sterling exchange rate at 1s. 4d. which was ruling when the war began. Therefore, the exchange rate was raised successively, in step with the rise in the price of silver to 1s. 4½d. in January 1917, 1s. 5d., in August 1917, 1s. 6d., in April 1918, 1s. 7d., in May 1919, 1s. 10d., in August 1919, 2s. 0d., in September 1919, 2s. 2d., in November 1919, and 2s. 4d., in December 1919. By the early months of 1920, the rate reached a peak of 2s. 11d.

For the period 1919-1921, again, it is extremely difficult to strike a balance of payments for the country. Only a partial picture can be gleaned even of the trade accounts, which themselves are, by no means, the most important element in a country's balance of payments especially in disturbed periods, such as those following a war. The private merchandise balance of trade is estimated to have amounted to a surplus of

\*G. B. Jather and S. G. Beri — *Indian Economics*, Vol. II, Oxford University Press, 1952, p. 164.

Rs. 126 crores in 1919-20 and a deficit of Rs. 80 crores in the following year. However, as stated before, not much should be read in this as this does not convey any idea of the net balance on current account.

For the years beginning 1921-22, a consistent series on estimates of India's balance of payments upto 1933-39 has been compiled by A. K. Banerji. In addition, the Government of India also started compiling balance of payments statistics from 1923-24 onwards for the League of Nations. However, for a number of reasons, including better coverage and superior methodology the series compiled by Banerji for the period 1921-39 is to be preferred. This is reproduced below:

TABLE III  
Estimates of India's Balance of Payments\*

| (Rs. crores) |               |                  |                       |
|--------------|---------------|------------------|-----------------------|
| Year         | Trade Balance | Invisibles (net) | Current Account (net) |
| 1921-22      | -9.6          | -77.9            | -87.5                 |
| 1922-23      | 46.3          | -109.8           | -63.5                 |
| 1923-24      | 111.3         | -119.7           | -8.4                  |
| 1924-25      | 85.6          | -126.0           | -40.4                 |
| 1925-26      | 113.2         | -121.1           | 12.1                  |
| 1926-27      | 68.8          | -59.0            | 9.8                   |
| 1927-28      | 82.4          | -111.5           | -29.1                 |
| 1928-29      | 89.9          | -109.8           | -19.9                 |
| 1929-30      | 88.2          | -84.7            | 3.5                   |
| 1930-31      | 61.3          | -84.3            | -23.0                 |
| 1931-32      | 109.3         | -84.3            | 25.0                  |
| 1932-33      | 85.1          | -89.3            | -4.2                  |
| 1933-34      | 108.6         | -107.9           | 0.7                   |
| 1934-35      | 90.8          | -95.7            | -4.9                  |
| 1935-36      | 81.7          | -61.8            | 19.9                  |
| 1936-37      | 111.4         | -91.2            | 20.2                  |
| 1937-38      | 75.2          | -89.1            | -13.9                 |
| 1938-39      | 73.8          | -86.2            | -12.4                 |

The most striking feature of the above Table is the extent to which the invisibles account dominated the current account of the balance of payments. The fact that the country always owed net payments to the rest of the world on this account will be commented upon and the underlying factors explained in the following paragraphs. It may be noted, however, that the net payments on account of all invisible items taken

\*Arun Kumar Banerji — *India's Balance of Payments*, Asia Publishing House, 1961, p. 147.

together averaged about Rs. 95 crores per year and were entirely responsible for turning the average annual trade surplus of about Rs. 83 crores into a small average annual current account deficit of about Rs. 12 crores.

External resources were required for meeting, among other things, certain invisible payments commonly called the 'Home Charges'. These consisted of the gross sterling expenditure incurred in the United Kingdom by the Government of India mainly on account of first, recruitment of British personnel for civil and military employment in India and their furlough pay and pensions; secondly, payment of the Government of India's share of the expenditure incurred by the British Government in wars in adjoining territories such as Afghanistan and Burma; thirdly, purchase of stores; and lastly, other miscellaneous payments owed by the Government of India to the British Government. All these payments added up to a sizeable amount which went on growing steadily upto 1922-23 and then stabilized itself around a level of £30 millions per year with minor variations around that level. Of this, the amount spent on purchases of stores should properly be regarded as payment for imports on Government account and only the balance should be considered as invisible payments. However, the bulk of the gross sterling expenditure was on account of the other items. The impact of the 'Home Charges' on the country's balance of payments became acute when during the Depression years, the country's trade surplus dwindled rapidly and other means had to be found for meeting the 'Home Charges'. A series of inter-related factors including a fall in the prices of primary products as well as overvaluation of the rupee at the exchange rate of 2s : Re. 1, combined to produce gold exports as the means of financing the 'Home Charges'. Thus, from a net importer of treasure (mainly gold) of about Rs. 31 crores per year during the quinquennium 1926-31, the country turned into a net exporter of gold worth Rs. 53 crores per year in the next quinquennium 1931-36.

Apart from 'Home Charges', India had another recurring and fixed overseas liability to meet each year in the shape of the servicing charges against the sterling debt held by the Government of India. It has been estimated that the foreign-held portion of the Government of India's sterling debt was of the value of over Rs. 370 crores at the end of 1921 and had increased to about Rs. 450 crores\* by 1938. The interest charges payable against these sums amounted to an annual average of Rs. 18 crores\* during the period 1921-22 to 1938-39.

In addition to the sterling debt of the Government of India, there were sizeable foreign private investments in India in the public utilities, especially, railways, plantations, mines, industry, commerce, banking,

---

\**Ibid.*, Table XXV, p. 88.

etc. Several estimates have been made by different persons of the value of total foreign investments in India at different points of time some of which are briefly summarized below:

TABLE IV  
Estimates of Foreign Investments in India\*

| Estimated by                             | Value<br>£ m. | Year to<br>which<br>estimate relates | Coverage                                                                                                                                                                                                                                                                                                                                                                          |

| 11. B. R. Shenoy       | 830                   | 1939                                          | Total foreign investments in India.                                                                                                                                                                                                                 |

It is certain from the available evidence\* that the value of the total foreign indebtedness of the country must have been around £ 500 m. (or Rs. 666 crores) in the thirties and over £ 650 m. (or Rs. 867 crores) on the eve of the Second World War. The average servicing charges against these foreign investments (including the sterling debt of the Government of India) were about Rs. 50 crores per year during the seventeen year period 1921-22 to 1938-39\*\*.

While any precise estimate of the amount of the Government of India's debt held abroad is difficult to hazard, there is no doubt that the amount was sizeable. At the end of 1939-40, for example, out of the total Central Government debt of Rs. 1,204 crores, no less than Rs. 439 crores consisted of sterling loans, while a considerable portion of the rupee debt of Rs. 450 crores must also have been held abroad.\*\*\* However, the greater part of the sterling debt of the Government of India was repatriated, over the years 1937-48 and the value of the sterling debt thus repatriated was £ 327 m. (or Rs. 437 crores).\*\*\*\*

\*For an excellent discussion of these various estimates and their relative merits and drawbacks, see Banerji, *op. cit.*, pp. 150-186 and *Census of India's Foreign Liabilities and Assets*, *op. cit.*, pp. 14-16.

\*\*Arun Kumar Banerji, *op. cit.*, Table XXV, p. 88.

\*\*\*The balance of Rs. 315 crores consisted of small savings, Treasury Bills, Ways and Means, Advances and other interest-bearing obligations. See G. B. Jathar and S. G. Beri, *Indian Economics*, Vol. II, p. 404.

\*\*\*\**Ibid.*, p. 467.

**Private Foreign Investment Before Independence:** The wide divergence between the different estimates of total foreign investment in the country prior to independence arises mainly on account of the divergence in the estimates of the portion relating to private foreign investment in the country, as figures of external public debt are less controversial.\* According to Banerji's estimates, of the total foreign investments of £ 531 m. and £ 664 m. at the end of 1921 and 1938 respectively, about £ 246 m. and £ 324 m. respectively, were in the private sector including railways and other utilities as well.\*\* This worked out to roughly 46-47 per cent of the total.

During the seventeen year period 1921-22 to 1938-39, when according to Banerji, aggregate net foreign indebtedness of the country increased by about £ 133 m., the gross inflow of capital into the country was much larger, since there always was a steady stream of repatriation as well. On an average, the total gross inflow of foreign capital into the country was placed at around Rs. 20 crores per year, while total repayments averaged about Rs. 10 crores per year. Net new foreign investment in the country was of the order of Rs. 10 crores per year.\*\*\* It may be noted here that these annual averages obscure the wide fluctuations in capital flows which occurred during this period. Thus, in the gross inflow of capital (chiefly the borrowings on the London Stock Exchange, valued at issue price) at least four different phases can be discerned: first, the period 1921-24, when the annual average of gross inflow was around Rs. 48 crores; next, the period 1924-30, when it fell to Rs. 11 crores; secondly, the period 1930-34, when it again rose to Rs. 27 crores; and finally, the period 1934-39, when the annual average of gross inflow shrank to Rs. 7 crores only.

It should, however, be added, that the greater part of the inflow during the years 1927-32 was by Government. Investment in other avenues had, more or less, completely petered out during these years. Foreign investment in Indian railways had tapered off before this period, and there was practically no new foreign investment in this segment after 1925-26. Investment in such semi-governmental bodies as Port Trusts, Corporations, Improvement Trusts, which had averaged £ 1.8 m. a year during 1921-26, virtually ceased after that. Public utilities other than railways, such as electricity, tramways, gas and telephone companies were fairly steady borrowers on the London Stock Exchange and were interrupted only during the years 1927-32. Borrowing by the plantations, which had averaged £ 0.23 m. annually in the earlier years,

---

\*The chief point of dispute and divergence here is the estimation of the portion of the Government's rupee debt which was held by foreigners.

\*\**op. cit.*, pp. 175 and 183

\*\*\*Banerji, *op. cit.*, p. 195

tapered off almost completely by 1931-32, presumably on account of the steep fall in the prices of plantation crops during the Depression. Foreign investment in other industries was fitful and desultory and, in any event, was not on any significant scale.

While annual repatriation of foreign capital from India, including repayments of loans, did not show any serious fluctuations, there was a sharp increase in the rate from 1931-32 onwards, which was mostly due to discharge of the public debt. The latter averaged about Rs. 2.7 crores per year during 1921-31; during the next six years, the annual average increased to a little over Rs. 18 crores; after that it declined sharply again. Total repayments, which were obviously dominated by repayments of public debt, naturally followed a parallel trend. Their annual average increased from Rs. 4.3 crores during 1921-31 to about Rs. 18 crores during the next six years, before falling sharply again in 1937-39.

**World War II and the Sterling Balances:** No reliable estimates of the country's balance of payments during the years of the Second World War are available. However, it is not difficult to form certain qualitative judgements about the position during the years. With the rapid extension of the theatre of war, first, on the continent of Europe and then in South-East Asia, India's trade with some of her important trading partners abruptly ended in quick succession. There was a rise in shipping freight rates as well as in the freight element in prices on account of the need to revive the use of the Cape route (after Italy entered the war); insurance rates increased on account of the increased risk of loss on the high seas; in order to conserve foreign exchange for war purposes almost all countries introduced exchange and other controls on their foreign trade. All these factors tended to reduce the size of India's foreign trade.

These adverse factors were, however, more than counter-balanced by several favourable factors, which also arose directly out of the war. These included the great upsurge in the British demand for war materials as well as peace time goods of every description; the stimulation of demand for Indian goods from the markets of the Middle and Near East, where a great void had been created by the withdrawal of British, American, German and Japanese supplies from them; the emergence of India as the chief arsenal and supply centre for the Allies in the South-East Asian theatre of war and a pronounced tendency in all countries to substitute nearer supply centres for distant ones and to rely more on land trade than on sea-borne trade, owing to Germany's intense U-boat activity.

An indirect measure of what happened to the country's balance of payments in consequence of the several developments briefly mentioned here can be obtained from the phenomenal growth of India's sterling

balances. This would indicate the rough magnitude of the cumulative current account surpluses acquired by the country during the war years. In September 1939, when the war broke out, these balances amounted to £ 52 m. On August 14, 1947, the eve of independence, they had swollen to £ 1,160 m., broadly reflecting the excess of India's supplies to the United Kingdom and Allies over its payments to them for the imports of goods and services. Two agreements were concluded between India and the United Kingdom concerning the disposal of this colossal amount, of which the first one was an Interim Agreement which chiefly prescribed the mode of releases from this blocked amount for current purposes and also the amount of releases for the period upto the end of December 1947.

The final agreement, which was signed on July 9, 1948, included provisions on at least five important matters: first, it was agreed that India should pay £ 100 m. in full and final settlement of all the stores and installations taken over from the United Kingdom; secondly, India agreed to pay a sum of £ 168. m. to the U.K. for the purchase of tapering annuities to pay the sterling pensions of British personnel who had retired after Government service in India; thirdly, after striking the final account of undivided India for 1946-47, it was found that the U.K. still owed some £ 49 m. under the scheme of sharing defence expenditure between the two countries; after making certain other adjustments, the net amount payable by the U.K. was finally assessed at £ 55 m.; next, the release for current purposes (to Account No. 1) from the blocked balances (Account No. 2) was to be £ 80 m. for the period July 1, 1948 to June 30, 1951, over and above the unspent balance of £ 80 m. from previous releases, which was free to be carried over; and finally, it was agreed to release £ 15 m. as convertible currency for the first year (1948) and the position in this regard was subject to review in later years. After making all the adjustments, India's net share of the sterling balances came to £ 800 m.

The accumulation of sterling balances of the value of £800 m. (net) was an event of some considerable significance to the country's economy. For one thing, it altered its net international position from debtor to creditor. According to the Census of India's Foreign Liabilities and Assets carried out by the Reserve Bank of India as of mid 1948, India was shown to be a net creditor by Rs. 1,504.5 crores\*. Several reservations and qualifications need to be taken into account in order to grasp the true significance of the international net creditor position revealed by the Reserve Bank of India's study. However, these will be discussed elsewhere in this chapter. For the present, it is sufficient to point out

\*Reserve Bank of India: *Survey of India's Foreign liabilities and Assets*, Bombay, 1953

the change in the country's international creditor-debtor position. It should also be emphasized that while the subtle process of external capital formation was, no doubt, at the cost of the immense hardships and privations, suffered by the people of India during the war years in the form of rising prices and falling civilian consumption standards, it had its own advantages too. Perhaps, the greater advantage was the fact that but for the availability of such a large cushion of foreign exchange reserves, it would have been quite difficult to think in terms of Five Year Plans involving large scale investment outlays.

To sum up the position on the eve of independence, from the external resources angle, the Indian economy had the following important characteristics:—

(i) Unlike the belligerent countries, there was no devastation and destruction of the Indian economy during the Second World War; on the contrary, a certain degree of industrialization had been achieved both under the stimulus of war demand and under the protection of exchange and import controls.

(ii) An efficient machinery for the regulation of foreign trade had been built up under the Defence of India Rules in the form of exchange controls and quantitative controls on imports and exports. Although set up for serving the ends of the war effort, it made a valuable addition to the country's somewhat limited repertoire of instruments of economic policy.

(iii) Thanks to the conjuncture of developments, such as the withdrawal of the principal industrialized countries from markets adjacent to India, increased preference for land trade rather than sea-borne trade, etc., India had developed almost by force of circumstances, rather than by conscious planning, a fairly flourishing export trade in the Middle, Near and Far East and in South-East Asia.

(iv) Again, by force of circumstances, she had achieved external capital formation on an unprecedented scale and had laid by £ 800 m. of sterling balances, which would be of crucial importance to her in subsequent years.

(v) As against these favourable factors, there were several developments which portended acute economic strain. Not the least among these was the considerable volume of pent up demand for food and consumer goods of all kinds, which had been built up. Inflation had been on the rampage during the war and early post-war years and had naturally created a serious imbalance between supply and demand. This was particularly true of civilian supplies. While the growth of money incomes had proceeded steadily over the war years, the commandeering of a large portion of the existing supplies for the war effort as well as

the war-time neglect of agriculture coupled with a succession of crop failures which had created a situation of acute food scarcity, had all contributed to a continuous spiralling upwards of the prices of all consumer goods and particularly, of food articles. Consequently, there was considerable pent up demand. The policy implication of this situation was clear. A large part of the country's external resources was likely to be taken up by imports of, at least, the essential consumer articles, if either a price explosion or a drastic deflation were to be averted.

(vi) Another factor which had to be reckoned with in assessing the likely claims against the apparently large sum of £800 m. of external resources was the heavy depreciation of the capital stock of the country which had occurred during the war and early post-war years. This depreciation was the result of abnormally intensive use of the country's capital equipment on account of the war effort; the absence of indigenous production of most kinds of capital equipment; and the inability of the main producing countries to export. Factories, mills, workshops, etc., in the country as well as the transport system, consisting of both rail tracks and rolling stock had carried on without practically any replacement for years. All these had to be replaced, even if gradually.

(vii) Superimposed on the strains inherent in these developments was the dislocation caused by the partition of the country into the Indian Union and Pakistan. There was considerable industrial dislocation, especially, in the affected border areas. Besides, large cross currents of migrating populations also introduced a new element of unsettlement, which caused a fall in production.

It would, therefore, be seen that it would have been fallacious to regard the apparently large sum of £800 m. as an unencumbered legacy available exclusively for meeting the needs of development in the early years of independence. Taking account of the requirements of external finance for development, the sum was, indeed, not too large. At the same time, it was sufficient to make a beginning in planned development of the country, which was the major economic task before the country.

### III. Independence and Planned Development

The role of external resources in the Indian economy has been changing rapidly in the years after independence. The evolution of Indian policies, on the one hand, and the part played in the Indian economy by external resources, on the other, can be considered in a number of separate phases. The first phase would be the period after independence and prior to the launching of the First Plan, characterized by an attempt to tackle immediate problems while marshalling data and formulating policies for future development. The second phase can be said to consist of the first decade of planned development ending in March 1961.

And then we come to the phase we are passing through today.

**The First Phase (August 1947 - March 1951):** On the eve of independence, India's sterling balances, as we have seen, amounted to a total of £ 1,160 million which, as a result of various adjustments in pursuance of the Indo-U.K. Financial Agreement of 1947, came down to a net amount of about £ 800 million (Rs. 1,064 crores), as India's share. There were heavy drafts on these balances after independence to finance sizeable deficits in India's external trade which began to appear in the wake of partition.

Many of the commodities which had occupied places of importance in India's export trade before partition were the produce of areas which became parts of Pakistan. As a result of partition, not only did India cease to be a major exporter of these commodities, but, in certain instances, she became a large importer of them. Thus, for raw jute, India was a net exporter of Rs. 19 crores in 1946-47; in 1948-49, she was a net importer of Rs. 46 crores. In foodgrains, the deterioration between 1946-47 and 1948-49 was over a hundred crores of rupees, though not all of it could be attributed to the partition of the country, and in cotton around Rs. 47 crores. Ordinarily much, if not all, of this loss should have been compensated by the fact that while in the past supplies from the rest of India to areas later included in Pakistan formed a part of the internal trade of the undivided country, after independence, they should have gone to augment India's export earnings. But the flow of trade between India and Pakistan was interrupted by the application of import and export restrictions as well as customs duties. In addition, political bitterness then prevailing in the wake of partition further impeded the flow of trade.

Apart from this particular factor, there were others creating a demand for imports and a decline in exports. The population had been increasing. There had been throughout the war years a considerable increase in money supply. And there was a pent up demand for imports which had to be satisfied, not merely for consumer goods but also for the replacement of plant and machinery worn out during the war years.

In order to deal with the immediate problems arising out of the adverse turn in the country's foreign trade, the import policy was tightened up and in two concrete measures, explicit recognition was given, for the first time, to the importance of exports to the national economy; those measures were the passing of a Resolution on Industrial Policy on April 6, 1948 and the setting up in 1949 of an Export Promotion Committee. While the former emphasized the production of commodities for export for earning foreign exchange, the latter was assigned the task of recommending specific measures to augment India's export earnings.

In September 1949, sterling was devalued and the Indian rupee with it.

Shortly thereafter, hostilities broke out in Korea. The combined effect of these was to lead to an upsurge in the demand for many Indian products, particularly jute goods which were sold at unprecedented prices. The adverse trade gap was wiped out and the sterling balances which had fallen to the low level of Rs. 771 crores on September 16, 1949 went up to Rs. 884 crores by March 1951.

Even while attention was focussed on these short-term fluctuations in current trading, some forward thinking on the subject of external resources was taking place. To provide a foundation for it, the Reserve Bank of India undertook a census of India's foreign liabilities and assets as on June 30, 1948. At the same time, thought was given by Government to the role which private foreign capital should play in independent India.

Unlike the previous attempts in the field, which focussed on estimating foreign investments in India, the census carried out by the Reserve Bank of India encompassed the whole gamut of the country's assets as well as liabilities. Among other things, it revealed the transformation of the economy from a net international debtor to a net international creditor. According to the census, taking both the official and non-official sectors together, India had a net creditor position of Rs. 1,504.5 crores at the end of June 1948. This comprised of a net creditor position of Rs. 1,761.5 crores in the official sector and a net debtor position of Rs. 257 crores in the non-official sector. The official sector's total gross assets of Rs. 1,939.6 crores comprised long-term assets of Rs. 730.8 crores and short-term assets of Rs. 1,208.8 crores, which consisted almost entirely of the sterling balances. As against this, the total gross liabilities of the official sector were estimated at Rs. 178.1 crores resulting in a net creditor position of Rs. 1,761.5 crores.

The non-official sector's net debtor position of Rs. 257 crores emerged from gross assets of Rs. 69.1 crores more than offset by gross liabilities of Rs. 326.1 crores. Gross total assets were composed of Rs. 11.5 crores in short-term and Rs. 57.6 crores in long-term assets. Gross total liabilities consisted of Rs. 38.4 crores in short-term liabilities and Rs. 287.7 crores in long-term liabilities.

Out of total long-term foreign liabilities of Rs. 287.7 crores of the non-official sector, foreign non-banking business investments accounted for Rs. 264.6 crores, of which about 80 per cent was in the form of direct investment, the balance of 20 per cent being portfolio capital. On a sector-wise basis, out of the total, Rs. 70.7 crores was invested in manufacturing, Rs. 52.2 crores in plantations, Rs. 43 crores in trading activities, Rs. 31.5 crores in construction, utilities and transport, Rs. 22.3 crores in petroleum, Rs. 15.7 crores in financial services, Rs. 11.5 crores in mining and Rs. 17.7 crores in other miscellaneous activities.

In the period immediately following independence, there were many

uncertainties and doubts about the attitude which independent India would adopt towards private foreign capital. Prior to independence, Indian public opinion was far from favourable towards the inflow of private foreign capital. The Fiscal Commission of 1923, for example, drew attention to the distrust of foreign capital while recommending its guarded use for industrialization. A minority minute of dissent had urged the adoption of certain safeguards in regard to foreign capital, particularly that foreign capital invested in manufacture should be in a company incorporated and registered in India, in rupee capital with a reasonable number of Indians on the Board of Directors and offering reasonable facilities for the training of Indians. The External Capital Committee (1925) of the Government of India had emphasized that when concessions to foreign capital were being granted (e.g. in the shape of protection), no special discrimination in favour of foreign capital should be permitted. The National Planning Committee (1936) with Jawaharlal Nehru as Chairman and later the Advisory Planning Board (1946) had both generally opposed the entry of foreign capital, except under the most rigorous control.

The change in the attitude towards foreign capital which followed independence is specially interesting. This was based on a recognition of certain basic facts. First, it was evident that India would need a good deal of external resources for her future economic development and as things then stood, when governmental aid and credits from developed to developing countries were not anywhere on the horizon, private foreign capital was one of the most important sources of such external resources. Secondly, with independence and the end of political domination, there had been a radical change in the equations. In independent India, foreign capital could no longer dominate the Indian economy and it had to function within the frame-work of national policies. In the altered circumstances the question was not so much of ensuring that there was no discrimination in favour of foreign capital, as recommended by the External Capital Committee of 1925, as of assuring foreign capital that there would be no discrimination against it.

The first articulate expression of free India's attitude towards foreign capital was embodied in the Industrial Policy Resolution of 1948 which emphasized, at once, the need for carefully regulating as well as inviting private foreign capital. It laid special stress, *inter alia*, on the need to ensure that in all cases of foreign collaboration, the majority interest was always Indian. This was followed by the Fiscal Commission of 1949-50 which recommended that foreign investment may be permitted first, in public sector projects needing imported capital goods and secondly, in new private industries where no indigenous capital or technical know-how was likely to be available.

The corner-stone of independent India's attitude towards private foreign capital was, however, laid by Prime Minister Jawaharlal Nehru in his historic statement in the Constituent Assembly on April 6, 1949, in the following words:

"In the first place, Government would expect all undertakings, Indian or foreign, to conform to the general requirements of their industrial policy. Government would also so frame their policy as to enable further foreign capital to be invested in India on terms and conditions that are mutually advantageous.

"Secondly, we do not foresee any difficulty in continuing the existing facilities for remittance of profits, and Government have no intention to place any restriction on withdrawal of foreign capital investments, but remittance facilities would naturally depend on foreign exchange considerations.

"Thirdly, if and when foreign enterprises are compulsorily acquired, compensation will be paid on a fair and equitable basis as already announced in Government's statement of policy.

"As a rule, the major interest in ownership and effective control of an undertaking should be in Indian hands. Government will not object to foreign capital having control of a concern for a limited period, if it is found to be in the national interest."

**The First Two Plans:** India's First Five Year Plan was launched on April 1, 1951. As pointed out earlier, the outbreak of hostilities in Korea had given a fillip to India's exports in 1950-51 and there had been a steady increase in India's sterling balances. The reserves' position on April 1, 1951 was fairly comfortable, the actual figure being Rs. 1,029 crores. Even so, the Plan recognized the need for foreign aid and assigned an important place to the inflow of foreign capital. The Plan calculations about foreign exchange suggested a balance of payments deficit of as high as Rs. 180 to Rs. 200 crores per annum, and a deficit of this magnitude was considered necessary to fulfil the investment targets on schedule. It was intended that a little more than half of the overall deficit should be met by drawing upon the sterling balances and the remainder, something like Rs. 230 crores, would be covered by foreign aid and private foreign investment. In actual fact, the draft on reserves during the First Plan was no more than Rs. 127 crores. This was due to several factors. It had been estimated that the current account deficit (excluding official donations) would be in the region of Rs. 700 crores. Actually, the gap was only a little above Rs. 150 crores. Official donations made a modest contribution of Rs. 109 crores towards closing this gap. Thus, the current account deficit, after allowing for receipts on official donations, had only a relatively small impact on the reserves position. If, in the event, reserves declined by Rs. 127 crores, in spite of

receipts of official loans of Rs. 106 crores (including the U.S. Wheat Loan), it was due to substantial outflows on account of private capital as well as unidentified transactions, in addition to a repayment of Rs. 42 crores to the International Monetary Fund.

A series of events were responsible for this outcome. Not the least of these was the fact that due to a succession of good monsoons and, therefore, of good crops, food imports were much less than was contemplated in the Plan. Again, the Korean War boom had given an extraordinary fillip to export earnings and the record earnings of Rs. 730 odd crores in the very first year of the Plan could not fail to influence the over-all payments position during the Plan period. Another important contributory factor was the shortfall in actual investment outlay as compared to planned outlay. As against a total Plan provision (maximum) for investment of Rs. 3,600 crores, the actual investment turned out to be Rs. 3,360 crores or about 93 per cent of the target. The combined result of all these developments was that the total aid utilized in the First Plan was just over Rs. 200 crores, which, excluding the U.S. Wheat Loan because of its special character, accounted for only 3.3 per cent of the total investments during the Plan.

In a sense, this turn of events in the First Plan was responsible for a degree of complacency when consideration was being given to the external resources required for the Second Plan. The favourable trend in agricultural production during the First Plan engendered the belief that it would not be necessary to have large imports in the Second Plan. It was also tacitly assumed that the ratio of the current account deficit to total planned investment (both in the public and the private sectors) would be of the same low order — 18 - 19 per cent — as in the First Plan despite the shift of accent from agriculture to industry. To accelerate the pace of industrial development, import licences were freely given for industrial plant and machinery of all kinds. In retrospect, it does not seem surprising that half-way through the Second Plan period, the country was confronted with serious difficulties on account of a shortage of external resources.

Briefly, the foreign exchange calculus of the Second Plan was something like this. Total investment envisaged in the Plan was Rs. 6,200 crores (comprising Rs. 3,800 crores in the public and Rs. 2,400 crores in the private sector). As against this, a current account deficit of Rs. 1,100 crores was visualized. Finance for this had to be found from external resources — including the use of Rs. 200 crores of foreign exchange, estimated receipts of private foreign capital (net) of Rs. 100 crores\* and foreign aid to the tune of Rs. 800 crores. This was, by no means a

---

\*Including an amount of about Rs. 22 crores which was the undisbursed balance of the World Bank's loans (authorized in the First Plan) for the private sector.

tall order; especially, the latter amount was expected to come from such diverse sources as bilateral as well as multilateral dispensers of aid, bankers' and suppliers' credits and floatation of public issues in foreign money markets. Broadly speaking, the estimated foreign aid receipts of Rs. 800 crores represented the aid requirements of the public sector and the remaining Rs. 100 crores those of the private sector. Particular mention may be made here of the credit of Rs. 63 crores arranged from the U.S.S.R. Government for the Bhilai Steel Plant and Rs. 33 crores jointly from the British Government and certain British bankers for the Durgapur Steel Plant. However, it is significant that it was not deemed necessary to arrange such credit for the third steel plant in the public sector at Rourkela.

**Foreign Exchange Crisis of 1957-58:** The actual turn of events in the Second Plan ran quite contrary to expectations. From Rs. 902 crores at the beginning of the Plan, foreign exchange reserves experienced a landslide decline of Rs. 587 crores in just 2½ years to Rs. 335 crores by the end of September 1958. In addition, the country had to borrow Rs. 89 crores (net) from the International Monetary Fund during the first half of the Second Plan. Comparatively, the role played by foreign aid in financing the current account deficit (excluding official donations) of Rs. 1,109 crores was of slightly lesser significance as the total utilization of aid amounted to about Rs. 519 crores, including Rs. 188 crores of imports financed under P.L. 480\*. It may also be added that on account of private long-term capital there was actually a net outflow of Rs. 38 crores during this period.

The principal causes of the dramatic events which led to the serious crisis have already been indicated. In terms of actual magnitudes, it is of the greatest significance that there was a sharp rise in imports. While the annual average level of exports showed a marginal fall of Rs. 9 crores from Rs. 622 crores in the First Plan period to Rs. 613 crores in the Second, the average level of imports soared from Rs. 730 crores per year in the First Plan to Rs. 1,081 crores in the Second. The trade gap, therefore, widened from an annual average of Rs. 108 crores to Rs. 468 crores during the same period. Net earnings from the services and other invisible items, such as private donations (but excluding official donations), also showed a small decline of Rs. 3 crores from Rs. 78 crores per year in the First Plan to Rs. 75 crores in the Second. However, the

---

\*In 1956 India signed the first P. L. 480 agreement with the U.S.A. for the supply of surplus agricultural commodities. The original Public Law 480 legislation of the U.S.A. enacted in 1954, provides for sales by the U.S.A., of agricultural commodities to developing nations on concessional terms. Agricultural commodities supplied to India under this programme have played an important role in fighting food scarcity and shortage of certain other commodities like raw cotton and oil-seeds.

excess of the country's current payments over current receipts widened from Rs. 31 crores per year in the First Plan to Rs. 378 crores per year in the Second. It is worth noting, however, in this context that the rapid increase in imports was solely the result of the sudden acceleration in the rate of investment.

Thus, already by the middle of the Plan, the loss of reserves had amounted to the astonishingly high figure of Rs. 567 crores as compared to the expected loss of Rs. 200 crores in the entire five year period. On September 30, 1958 only about Rs. 335 crores of foreign exchange was left in hand. In addition, as pointed out above, the country had run up a net outstanding liability of Rs. 95 crores to the International Monetary Fund. Over and above these difficulties, large payments which were due in the remaining half of the Plan had also cast their dark shadow.

A series of concerted measures had to be taken at once to salvage the economy from the difficult situation. The Plan was cut to the core. Import policy was drastically tightened. Imports of all consumer goods, except the most essential ones, such as, foodgrains were banned, while a moratorium was placed forthwith on imports of capital goods, unless there was specific foreign exchange cover for them, in the form of either official or private foreign credit or investment. Severe restrictions were also placed on all other foreign exchange payments, such as, those for foreign travel, private outward donations, etc. Some action was also initiated in the direction of export promotion. By far the most important measure, at any rate, from the point of view of obtaining direct and immediate results was, however, the determined effort made by the country to seek external assistance and the prompt and generous response to it from friendly foreign countries and international institutions. While India adopted a policy of approaching different countries/institutions individually, the World Bank which had already given ample proof of its friendly and active interest in the economic development of the country by investing large amounts in different projects in the country, took a significant step forward by sponsoring a meeting of India's principal suppliers of capital goods to consider India's immediate aid requirements jointly and to try to meet them in a co-ordinated manner. This meeting which was attended by the U.S.A., the U.K., West Germany, Canada and Japan, besides the World Bank who convened it, was the first meeting of what is generally referred to as the World Bank Consortium on India. At the meeting, general assurances were given of finance to cover the so-called core of the Second Plan, consisting mainly of the steel and fertilizer projects, which were under construction, and of ancillary development of coal, power and transport to sustain the increased steel production. The actual credits pledged at the meeting were supplemented by additional amounts at meetings of the Consortium in 1959 and 1960. Unfortunately, no additional pledges were

made in 1961 as the focus had by then shifted to the Third Plan and this was in part responsible for the pressure on reserves in 1960-61 and 1961-62.

The results of these concerted measures were both quick and telling. The precipitate decline in reserves was stemmed and in the remaining two and a half years of the Plan, they declined only by another Rs. 31 crores to Rs. 304 crores. Indeed, even this loss was occasioned chiefly by capital transactions, such as repayments of Rs. 35 crores to the International Monetary Fund. The overall deficit of Rs. 803 crores was fully covered by foreign aid. Taking the Second Plan as a whole, the total use of reserves amounted to Rs. 599 crores, net drawings on the International Monetary Fund to another Rs. 55 crores, and net receipts of banking capital to Rs. 3 crores. On the other hand, there was a net outflow of private capital of Rs. 27 crores during the period. The utilization of foreign aid during the Plan amounted to Rs. 1,441 crores, of which Rs. 543 crores was received in the form of commodity assistance under P.L. 480 etc. The balance of Rs. 898 crores comprised grants of Rs. 177 crores and loans and credits of Rs. 721 crores.

The stresses and strains to which the economy was subjected during the Second Plan were rewarding in many senses from a long-term point of view. The importance of external resources for the development of Indian economy came to be more explicitly recognized, not merely by economists and experts, but also by the people as a whole. Indeed, it would be no exaggeration to say that thinking in industrialized countries on the subject of aid to developing countries was greatly stimulated by observing what happened in India during the Second Plan period. The impressive increase in industrial production — it was nearly doubled over the first two Plans — and the demonstrable dependence of such a rate of development on external aid, created climate favourable to economic aid in many countries, most significantly in the U.S.A. In India, emphasis on export promotion, the importance of external aid and private foreign investment and the determination to plan future development in such a way as to enable the country after a certain specific period of time to develop without aid, came to be accepted as vital to the strategy of development.

At this point it seems relevant to refer to an important aspect of the evolution of India's commercial policy geared to the needs of the country's planned economic development. Bilateral trading arrangements based on rupee payments have come to be used widely with the objectives of (1) overcoming the persistent balance of payments difficulties through the avoidance of the use of gold or scarce foreign exchange resources; (2) diversifying and increasing Indian exports by opening up new markets for non-traditional exports and by reducing dependence on traditional markets; (3) obtaining capital goods and industrial raw material without

additional drafts on foreign exchange resources of convertible currency; (4) stabilizing prices of traditional exports; and (5) establishing direct trade contact with the centrally planned economies of Eastern Europe and Russia.

Bilateral trade based on non-convertible rupee financing, which is carried on mainly with East European countries and Russia, made rapid progress during the Second and Third Plans. Exports to Eastern Europe which averaged \$ 10 million in the First Plan (or below 1 per cent of total exports) rose to \$ 76 million and \$ 238 million in the Second and Third Plans respectively or about 6 per cent and 15 per cent of India's total exports. Similarly, imports from Eastern Europe which averaged \$ 12 million in the First Plan (or less than 1 per cent of the total) increased to \$ 76 million in the Second Plan and further to \$ 264 million in the Third or about 4 per cent and 10 per cent respectively of India's total imports.

The emergence of Eastern Europe as India's customer has thus had a great impact on India's exports and imports. Bulk of India's exports to these countries, however, continues to comprise traditional commodities, notwithstanding the diversification as reflected in the export of such non-traditional goods as ready-made garments, foot-wear, iron and steel, railway wagons, metal manufactures, etc. In contrast, and reflecting India's need for developmental imports, capital goods imports have shown a steady increase from about 45 per cent in 1960-61 to 61 per cent in 1965-66 of the total imports from these countries.

An important concomitant of the bilateral rupee payments arrangement entered into with these countries is the economic assistance (primarily credits) received by India for various development projects, which amounted to about \$ 1,271 million (aid authorized) upto the end of the Third Plan. In fact, the economic assistance received from these countries is largely responsible for the rapid increase in India's trade with them, since these credits financed larger imports while repayments of credits gave rise to increased exports to these countries and thus minimized the transfer problem.

**The Third Plan:** The Third Plan was conceived as a launching of a decade or more of intensive development leading to a self-reliant and highly developed economy, with a perspective of progressively diminishing proportion of external aid to total investment. Although the idea of self-reliance was implicit in the long-term growth models on which the First and the Second Plans were based, the Third Plan both explicitly stated self-reliance as a major goal for the 25 years period, 1951-76, and sought to give it a precise meaning. This strategy involved for a limited period, a considerable increase in imports, especially of capital goods, requiring substantial non-commercial foreign assistance. When the

preparation of the Third Five Year Plan was taken in hand, the difficulties experienced during the Second Plan period as a result of the inadequacy of external resources, were very much in the minds of the planners. The substantial contribution made by the external resources to economic development during the Second Plan period was another element encouraging the planners in adopting the strategy of significant dependence on external assistance for the Third Plan in the context of the longer-term strategy, covering the period upto 1975, to reach the stage of self-reliant growth. It was also clear that in the absence of sizeable external assistance, the Plan would have to be of a modest size, involving a rate of growth lower than the increase in population and consequently a stagnant level of per capita incomes.

To secure a satisfactory rate of growth in national income and in productive capacity, the Third Plan envisaged a substantial step up in investment to Rs. 10,400 crores, which was Rs. 200 crores higher than the investment outlays in the First and Second Plans taken together. It was abundantly clear that the country's foreign exchange reserves at a level of Rs. 300 crores at the beginning of the Plan, could no longer be drawn down to meet the foreign exchange needs of the Plan. Two questions had, therefore, to be faced; what would be the gap in external resources for a Plan of this magnitude and whether, in fact, external assistance would be available to fill it?

The foreign exchange calculations for the Third Plan showed total import requirements over the five-year period to be Rs. 6,030 crores.\* This was composed of the import component of investments assessed at Rs. 2,030 crores, general maintenance needs of Rs. 3,800 crores and Rs. 200 crores of components and intermediates required by the domestic capital goods industries. On the receipts side, earnings from exports were estimated at Rs. 3,700 crores. While the capital repayment liability in the Third Plan period was estimated at Rs. 550 crores, no surplus was expected from the invisibles account due to the mounting debt services payments. Thus, domestic capacity to finance imports was estimated at Rs. 3,150 crores as against import needs of Rs. 6,030 crores, and a gap of Rs. 2,880 crores emerged in foreign exchange resources indicating broadly the size of total aid required.

The amount of external assistance India sought for the Third Plan was Rs. 2,600 crores. Since this was Rs. 280 crores short of the estimated requirements, the direct import content of Plan projects was cut by Rs. 130 crores and the targets for maintenance of imports were reduced by another Rs. 150 crores.

Quite apart from the cuts made in import requirements in order to

---

\*This excluded Rs. 600 crores of foodgrains to be imported from the U.S. against payment in rupees under her P.L. 480 programme.

reduce the figure of external assistance needed for the Plan, the estimates of export earnings for the Plan period were placed at as high a figure as could, on any judgement, be possibly sustained. India was anxious not to seek more aid than was absolutely necessary.

The breakdown of the requirements of aid of Rs. 2,600 crores was as follows:

|                                               | (Rs. crores) |
|-----------------------------------------------|--------------|
| Import payment for Plan projects              | 1,900        |
| Maintenance needs of capital goods industries | 200          |
| Debt refinancing                              | 500          |

It is significant that the total aid requirement was related to import of capital goods, production of capital goods and repayment of capital. This was on the theory and in the belief that external assistance should be used for capital purposes only. While this view was, in a sense, sound it also led, it would seem, to a certain amount of confusion. For the repayment of capital to be made possible by external aid, either there had to be straight forward refinancing of outstanding loans, or a financing of the normal imports of the economy thus freeing resources generated by Indian exports for debt repayment. Another point which was lost sight of in this pattern of thinking was that the total requirements of external finance could not be equated to the payments due on imports of identifiable capital goods. Many projects in the course of their construction create indirect import demands and if these are not covered by assistance from outside, the setting up of the project may eat into the country's external resources, even though superficially the project is being financed by external aid. Another feature not adequately appreciated was that many of the schemes included in the development programme of the Third Plan were not in the nature of conventional projects. Thus, the programmes for agriculture, transport, health and education did require sizeable imports, but not of what is commonly known as capital goods. Some of the difficulties which arose in the implementation of the Third Plan were attributable to the fact that these points had been initially overlooked both by India and the countries helping her.

The attitude of the countries on whom India had to rely for assistance showed considerable appreciation of Indian needs and a genuine desire to help the developmental effort on which the country was about to embark. Two of the more important and concrete expressions of this appreciation were the visits to India of a Three Wise Men's Mission\* and the Hoffman Mission\*\* while the Third Plan was still on the anvil.

\*Consisting of Sir Oliver Franks (U.K.), Mr. Alan Sproul (U.S.A.) and Dr. Hermann Abs (W. Germany), top bankers from the respective countries.

\*\*Sponsored by the World Bank.

Both these missions examined the content and strategy of the draft Third Plan and the estimated foreign aid requirements and endorsed the view that the scale of aid estimated in the draft Plan was necessary for the successful implementation of the Plan targets.

The Aid India Consortium\* organized by the World Bank first met to consider India's aid requirements for the Third Plan in May-June 1961. Besides original participants, France and the International Development Association also attended the meeting and made pledges for assistance during the first year of the Third Plan. In the following year, Austria, Belgium, Italy and the Netherlands joined the Consortium. Since then, the Consortium regularly met for pledging assistance for each year of the Third Plan. The total amount pledged by the Consortium for the Third Plan as a whole aggregated to Rs. 2,606 crores.

In addition to the aid from the Consortium, India also received assistance from many countries outside the Consortium, notably the U.S.S.R. and other East European Countries. In fact, even before the Third Plan commenced, the U.S.S.R. and other East European countries had pledged assistance of Rs. 294 crores specially earmarked for the Third Plan projects. Additional commitments of aid outside the Consortium pledges were also made by a number of countries. There was also a sizeable amount of Rs. 1,285 crores of assistance authorized before the commencement of the Third Plan but not utilized by the end of the Second Plan period and was thus available for utilization during the Third Plan. Total authorization of external assistance during the Third Plan period amounted to Rs. 2,928.7 crores, Rs. 2,300.6 crores in

\*The World Bank, the U.S.A., the U.K., Canada, West Germany and Japan were the members of the Consortium.

\*\*At the prevailing exchange rate.

loans repayable in foreign currencies, Rs. 49.6 crores in loans repayable in rupees, grants of Rs. 127.9 crores, and P.L. 480 assistance of Rs. 450.6 crores.

Although the quantum of aid promised was fully in accord with the expectations of aid on which the Third Five Year Plan was framed, the country's foreign exchange position continued to be a constant cause of worry during the Third Plan period. The loss in the foreign exchange reserves during the first two years of the Third Plan could be held down to Rs. 8.5 crores only after a net drawing of Rs. 70 crores from the International Monetary Fund. In the third year, the position improved with a rise in reserves of Rs. 10.7 crores, even after a repurchase from the Fund of Rs. 23.8 crores. In the fourth year the reserves again suffered a loss of Rs. 56.1 crores, but this was substantially recouped in the last year of the Plan, partly with a net drawing of Rs. 29.8 crores from the International Monetary Fund. Thus, notwithstanding a net drawing of Rs. 76.3 crores from the Fund, the foreign exchange reserves showed a small decline of Rs. 5.6 crores over the Third Plan as a whole, while the Plan itself had envisaged no net drawing from the reserves.

Excluding commodity assistance under the P.L. 480, actual imports during the Third Plan averaged Rs. 1,047.5 crores a year which was below the Plan estimates of Rs. 1,150 crores. The export performance was also in line with the Plan expectations. It was estimated in the Plan that Rs. 3,700 crores would be realized from exports over the Plan period; in fact, the export earnings were Rs. 3,734 crores.

Where the Plan expectations did not materialize was mainly in the field of aid disbursements. External aid, other than commodity assistance, of Rs. 1,921 crores fell short of the Plan expectations by as much as 26 per cent. The position was worse still in the first three years of the Plan when the aid disbursements averaged about Rs. 329 crores per year. Shortfall in aid disbursements had many reasons and many consequences. It caused concern among the countries which were giving aid to India, no less than to the planners and the Government of India. The problem was analyzed on the one hand by the World Bank economists and, on the other in India by the committee set up under the Chairmanship of Prof. V. K. R. V. Rao in the Planning Commission. As a result of these studies, a number of measures were adopted, both by the Indian Government and by the Consortium countries, to expedite disbursements. The rate of utilization during the last two years of the Plan averaged sharply upwards to Rs. 468 crores per year.

**External Assistance received in the Three Plans:** During the fifteen years covered by the Three Plans, the total external assistance authorized amounted to \$ 12,217 million, of which loans accounted for \$ 8,048 million, grants \$ 813 million and P.L. 480/665 and Third Country

Currency assistance \$ 3,356 million. Assistance actually utilized amounted to \$ 9,397 million, \$ 5,752 million in loans, \$ 699 million in grants and \$ 2,946 million in P.L. 480/665 and Third Country Currency assistance.

**The Fourth Plan:** The last year of the Third Plan was one of considerable travail for the economy. Hostilities on a serious scale broke out on the country's north-western borders. Following the Chinese incursion into the Indian territory in 1962, defence expenditure on both revenue and capital account had increased by Rs. 535 crores between 1960-61 and 1963-64. In the following year, *i.e.* 1964-65, there was a marginal decline of Rs. 10 crores under this head. The hostilities with Pakistan resulted in a setback to the hopes that could be entertained about reducing outlays on this score. At the same time, the foreign assistance picture turned cloudy, with aid-givers cutting off fresh authorization of assistance altogether for a few months. Of even more serious consequence was the widespread failure of the monsoon. Although in financial terms the Third Plan targets were reached by the end of the Plan period, several of the physical targets of production and capacity were in the result not achieved. The progress in the Third Plan period thus turned out to be less than adequate and less than anticipated. The most significant shortfalls occurred in the agricultural sector.

But the year following was to be worse still; for the second year in succession, the rains failed badly. In 1966-67, therefore, the country faced unprecedented difficulties in the form of severe drought conditions over large part of the country. Stringent restrictions were placed on imports, huge funds having to be provided for commercial imports of food, while the setback in agriculture reduced availabilities for exports and contributed to the fall in export earnings. Not only did the fall in agricultural outturn lower the quantum of agricultural and agro-based export commodities available for export, but given the importance of prices of food and other agricultural commodities in the general price level, contributed to the growth of inflationary situation which militated increasingly against the competitiveness of our exports in the world markets. Measures taken in early 1966 to maximize exports, such as export incentives through import entitlements, tax credits and other forms of assistance for exports, simultaneously with further tightening of imports and raising of import duties, proved inadequate to meet the situation as it developed. Export earnings failed to register any improvement. Private imports were cut down severely to reduce the import bill. But this process adversely affected domestic production of those sectors of industry which were dependent on imports. A net drawing of Rs. 89.3 crores was made on the Fund in April 1966 to meet the pressure on reserves.

The selective export incentive measures, such as import entitlement schemes, tax credits and subsidies aimed at compensating the export industries for higher domestic costs, proved progressively inadequate as the inflationary momentum in the economy gathered strength both by the fall in agricultural output and cut in imports and they needed to be, and were, periodically revised by augmenting their range and quantum. These could only serve as *ad hoc* palliatives. It was felt that more radical measures were necessary to reduce the growing imbalances in the economy including those in its external sector, and what was needed to bring about an enduring prospect of growth was a better realignment of domestic and external prices through a change in the par value of the rupee. This was done on June 6, 1966, by devaluing the rupee by 36.5 per cent.

An exchange rate realignment has a pervasive effect throughout the economy, as against the temporary and limited influence of selective export incentive measures and administrative import controls. It can be expected to deal with the disequilibrium in the balance of payments through market forces so long as autonomous additions to domestic money incomes are avoided to hold down the price level. Trade policy was accordingly refashioned and liberal policy for imports was adopted. A revenue duty of 10 per cent *ad valorem* introduced in February 1965 was abolished. The duties on items of imports other than consumer goods were reduced. But in the event inflationary increases in domestic money incomes were not prevented. In the context of the famine conditions in large tracts of the country and the political and social imperatives directly attributable to them, efforts to eliminate deficit financing were not successful.

The beneficial results expected from devaluation were almost entirely frustrated by the failure of 1966 monsoon and the consequent setback in agricultural production in the 1966-67 season. Emphasis in the economic field had to be given to measures aimed at the short-term objectives while longer-term development and investment had to be allowed to suffer. The Fourth Plan due to start in April 1968 was not formulated and an interregnum in planning through five-year developmental plans ensued. It was clear that the need of the hour was to achieve a measure of stability in the economy before the pace of progress could be resumed or accelerated. When the rupee was devalued, sizeable external assistance was secured with a view to providing for the minimum food needs of the population and to reactivate as quickly as possible the surplus capacity in large sections of industry following a cut back in import of raw materials and components. The Aid Indian Consortium pledged non-project assistance of \$ 900 million to support the import liberalization programme adopted in June 1966. Aid authorizations proportionately increased from \$ 1,362 million in 1965-66 to \$ 2,082 million in 1966-67.

The second successive failure of the monsoon, however, brought about a further deterioration in economic activity. Though in money terms the total investment in the economy during 1966-67 was of the same order as in the previous year, namely Rs. 2,800 crores, there was in real terms a decline in investment, because the prices of inputs of capital formation were higher. The rate of investment as a proportion of national income declined to 12.2 per cent from 13.8 per cent in 1965-66. In the circumstances, the sizeable foreign assistance arranged did not come to be utilized as quickly as it was hoped and anticipated. The utilization of assistance dropped from \$ 1,621 million in 1965-66 to \$ 1,474 million in 1966-67, affected in part by the temporary pause in fresh authorization following the outbreak of hostilities with Pakistan in September 1965. There was a sharp decline in utilization of loans other than P.L. 480 loans from \$ 912 million to \$ 792.5 million and a fall from \$ 525.4 million to \$ 447.2 million in gross receipts under P.L. 480 Title I. There was, however, a modest offset to this fall in utilization by the rise in utilization of grants other than under P.L. 480 Title I from \$ 72.2 million to \$ 87.3 million. Imports other than those under P.L. 480 Title I were held down to \$ 2,246.8 million from \$ 2,278.7 million in 1965-66, but exports also declined from \$ 1,641.8 million to \$ 1,534.8 million, partly affected by the dislocation in the export trade immediately following the devaluation of the rupee. With gross invisible receipts down from \$ 422.7 million in 1965-66, during which they were assisted by the inflow under the National Defence Remittance Scheme, to \$ 355.6 million in 1966-67, the current account deficit in the balance of payments widened over the year by \$ 65 million to \$ 1,373.4 million. To meet the overall deficit, a net drawing from the Fund of \$ 130 million had to be made, which was more than double that in 1965-66 when the amount involved was \$ 62.6 million.

The Fourth Plan should ordinarily have commenced in 1966 on the expiry of the Third Plan but for these exceptional difficulties experienced by the economy during 1965-66 and 1966-67. Though the necessary preparatory work had been undertaken and a Draft outline was brought out in August 1966, the finalization of the Fourth Plan was delayed due to the severe stresses which developed in the economy and as, with the lapse of time, many of the assumptions and estimates of the Draft outline were no longer valid. A revised Draft of the Fourth Plan, 1969-74, was published in April 1969 and this was later adopted with some modifications by the National Development Council in March 1970.

In formulating the revised Fourth Plan, the successes and failures of Indian planning so far, the trends in the economy and in particular the experiences of 1965-67 played an important role. The Fourth Plan aims at development in conditions of stability and reduced uncertainties — the former being dependent upon the supplies and prices of agri-

cultural commodities particularly of food and the later through minimizing dependence on foreign aid. Recognizing the close inter relationship between the level of prices, ability of the Government to raise resources, Plan outlays, industrial activity and export growth, the Fourth Plan aims at a continuing increase in agricultural production and building of sizeable buffer stocks to even out supplies of foodgrains. As an essential pre-requisite to relative stability, the Plan emphasizes the need to mobilize internal resources in a non-inflationary manner and to relate the Plan outlays to the possibility of raising resources without giving rise to inflationary pressures. The Plan also seeks to safeguard the growth rate against uncertainties of external resources by reducing the country's dependence on foreign aid; and from this point of view, it is planned to do away with P.L. 480 imports, while foreign aid net of amortization and interest payments is proposed to be reduced by about half of the present level by the end of the Fourth Plan. As an important step towards the goal of self-reliance, the Plan aims at securing balances on international account by limiting the growth of imports to manageable proportions through increased agricultural and industrial production and by providing for an increase in exports of about 7 per cent a year.

With these policy objectives in view and in order to accelerate the pace of economic activity so as to provide productive employment and bring about significant improvement in living standards, the Plan provides for an initial outlay of Rs. 24,882 crores, of which Rs. 15,902 crores or over 60 per cent would be in the public sector. Of the total public sector outlay, as much as 24 per cent is allocated for agriculture, irrigation and flood control, 21 per cent for industry and minerals, 20 per cent for transport and communication and another 15 per cent for power.

The total requirement of external resources during the Fourth Plan is estimated at Rs. 10,050 crores comprising imports valued at Rs. 9,630 crores, net outgo of Rs. 140 crores on account of invisible transactions and a repayment of Rs. 280 crores to the International Monetary Fund. This is exclusive of total debt service payments (amortization plus interest) estimated at Rs. 2,280 crores. This order of foreign exchange requirements will have to be met out of external assistance and export earnings. In accordance with the policy objective of reducing dependence on foreign aid, the aggregate external assistance (net of loan repayments) required during the Fourth Plan is estimated at Rs. 2,614 crores, thus leaving the balance of foreign exchange requirement amounting to Rs. 7,436 crores to be met out of export earnings. This implies that export earnings will have to go up from about Rs. 1,365 crores in 1968-69 to about Rs. 1,900 crores in 1973-74 or at a compound rate of about 7 per cent per annum. According to the Plan, this order of growth rate in exports does not appear to be beyond reach if a proper reorientation is

brought about in institutional arrangements and policies for export promotion.

Aggregate external assistance until the end of March 1969 has amounted to \$ 13,614 million out of the total authorization of \$ 16,546 million, leaving the outstanding amount of aid at \$ 2,719 million\* available for use from 1969-70 onwards. Loans account for \$ 11,207 million of the total assistance authorized, the share of grants being \$ 1,038 million, and that of P.L. 480/665 aid and Third Country Currency assistance \$ 4,301 million. Similar break up of utilization till the end of 1968-69 was \$ 8,664 million of loans, \$ 996 million of grants, \$ 3,954 million of P.L. 480/665 and Third Country Currency assistance. The carry over consists of \$ 2,524 million in loans, \$ 42 million in grants, and \$ 153 million in P.L. 480/665 aid and Third Country Currency assistance.

While it is impossible to form any kind of a historical view of the nature of problems and difficulties which were responsible for the very large gap which has been persisting between the commitment and disbursement of aid to India, it is possible to draw attention to some of them. India is, in a sense, a pilot project in the matter of international aid to a developing country. No doubt there had been a Marshal Plan before, under which massive aid had flown from the United States to war-devastated Europe. That kind of an approach was apparently not acceptable in the very different conditions under which aid was sought by, and being given to, India. India had first to prepare her Plan before aid could be pledged for it. By the time most of the aid giving countries had considered the Plan and were ready to make their commitments towards it, some months of the Plan period had already elapsed. Even after pledges were made at the Consortium meeting, it took a good deal of time for bilateral agreements to be negotiated and signed under which specific projects were picked up for financing by different members of the Consortium. And it was only thereafter that the whole physical process of starting construction, ordering and installing machinery could be taken in hand. On the Indian side too, much of the preparatory work which could have been not only started but completed before external aid was actually committed for different projects, was, as the Rao Committee pointed out, delayed for one reason or another. Once the project did get to a start, the pace of disbursement of aid was linked to the deliveries of plant and equipment for which order had been placed abroad and this, in the case of major projects, meant something like 2 or 3 years.

While procedural problems did contribute to the delays in the disbursement of aid, the study of aid utilization and attendant problems,

---

\*Adjusted for the devaluation of pound sterling and Danish Kroner in November 1967 and also for lapsed amounts in respect of P.L. 480 assistance.

which has been going on from year to year both in India and in the countries and international institutions giving aid to India, has resulted in many changes affecting some of the fundamental assumptions on which aid was being sought and given. The process is a continuing one. It is, however, possible to discern the main directions in which progress has been taking place.

First and foremost, there has been a growing recognition, both in India and outside, of the importance and value of aid which is not tied to projects. The basic consideration underlying this change is the fact that the gap in resources which external aid to fill in a developing economy is not to be measured by the cost of the direct import requirements of machinery and equipment of identifiable projects. In the last analysis, the gap is a gap between domestic savings and investment which, unless it is filled by an inflow of capital from outside, must result in inflationary pressures at home and balance of payments difficulties abroad. Other arguments have also been used to justify non-project aid, such as the indirect import costs of equipment and material delivered from domestic factories for Plan projects, the importance of getting the utmost production out of installed capacity as against creating additional capacity, the consideration that when aid is tied both to a country and to named projects, the recipient of aid usually has to pay a much higher price for what it imports, and finally, that the Plan consists not merely of projects, but of programmes in the field of agriculture, education, transport, health, etc., whose foreign exchange requirements cannot be covered by project aid. The proportion of non-project aid has, as a result, progressively increased from about 26 per cent of the aid authorized (excluding P.L. 480 assistance) during the Second Plan to 40 per cent in the Third Plan. It went up to 45 per cent in 1966-67 and to 82 per cent in each of the years 1967-68 and 1968-69.

The other favourable trend which is discernible is in regard to the terms on which aid is offered. Initially, much of the so-called aid which India received was really in the nature of commercial credits. Interest rates were commercial rates and consequently high. The repayment period was also very short. Thus in the Second Plan, the average rate of interest charged worked out, on rough basis, to 4.6 per cent. The average for the Third Plan on a similarly rough basis has come down to 4 per cent. Loans from the International Development Association, as well as from the Agency for International Development of the U.S. Government carry only nominal annual payments in the nature of service charges rather than interest proper. Credits from other sources too have been showing a definite improvement in regard to terms—both a lowering of rate of interest and spreading of repayments over longer period of time. During 1966/67-1968/69 the average, therefore, calculated on the same rough basis has declined to around 3 per cent per annum.

Welcome and helpful as these trends have been, much more clearly needs to be done over a longer period of time, given the balance of payments prospects of India. Debt servicing has been a growing burden on the Indian economy and it has been pre-empting a progressively rising share of the country's export earnings. Outlays on debt service on official loans alone have escalated from less than 3 per cent of the country's export earnings in the First Plan period to about 13 per cent in 1961-62 and nearly 25 per cent in 1966-67. This ratio was around 27 per cent in each of the two years, 1967-68 and 1968-69.

The combined effect of the various qualitative short-comings, despite quantitative adequacy, in regard to the aid which India has been receiving, was reflected in the continuance of an extremely tight foreign exchange situation in which industry continued to operate well below capacity in many sectors, adequate fertilizers could not be imported to meet the farmer's need and the rate of growth was slower than India or her friends could feel happy with.

**The Role of Private Foreign Capital:** The flow of aid from Government to Government discussed above is a relatively new development. Normally, the external resources which a country needs and can have at its disposal are obtained by way of inflow of foreign capital or by the country's own export effort. Historically, the inflow of private foreign capital has made a major contribution to the development of economies like those of the U.S.A. and Canada. Even today there are large movements of capital from one country to another. The view, therefore, is often expressed that if the developing countries of the world do enough to attract private foreign capital, the external resources, which they need for their development, can be found without any aid at Government level.

Such a view, though it still has its adherence among those who believe in the doctrine of *laissez-faire* and have an ideological bias against governmental action in the economic sphere, has rapidly lost ground in the last two decades, and in the light of the experience gained, it is now widely recognized that the volume of private foreign capital investment likely to go to developing countries, even if there was complete freedom on both sides in the matter, would quantitatively and qualitatively be inadequate for their needs. Investment opportunities in developing countries continue to rise. The fields in which private foreign capital seeks opportunities for external investment are limited — with mining and extractive industries in general being among the most important because such investments have to be made wherever the mineral resources exist. On the other hand, there are so many sectors of the economy in which developing countries have to invest, such as education and health, power and transport as also a variety of industries which have a high importance in national development plans which are likely to be un-

suitable or unattractive for private investment.

Quite apart from these limitations of size and scope, countries experiencing balance of payments difficulties have to take into account the cost of servicing foreign investment. Many developing countries, including India have such a heavy debt repayment burden that they are being cautioned against accepting credits on commercial terms as distinct from aid terms. Considering that equity investment must in the long run earn more, usually much more than loans, it would be difficult for a country, which shuns private foreign capital, to service foreign investment unless it imposes restrictions on remittances which inevitably lead to a drying up of fresh investment. Even though initially the remittance burden on new private foreign investment is not necessarily high because dividends can only be earned after the project begins to earn profits and upto a point profits are retained for plough back rather than remitted, over the long run retained profits increase earnings and thus the remittances.

To say this is not to suggest that private foreign capital cannot play a useful and a valuable role in helping development in a country like India. There are projects whose contribution to strengthening the country's balance of payments either by saving imports or by stimulating exports would far exceed the cost of servicing commercial debts or private foreign capital. With the tremendous shortage of capital that concerns most developing countries, the attempt must be to maximize the availability of capital and as neither domestic capital nor aid can meet the needs of development at an adequate rate, there is a good case for allowing private foreign capital on a selective basis in accord with the changing requirements of the economy. In addition, it has to be recognized that certain types of technology, ranging from the more sophisticated products of recent invention to managerial skills of a specialized nature are difficult to obtain except through some form of collaboration\* with a firm which is operationally making use of them. It is this realistic approach that lies behind the policy of the Government towards foreign capital and know-how and led the Government to announce towards the end of 1968 the industries (a) where foreign investment may be permitted with or without technical collaboration; (b) where foreign technical collaboration may be permitted but not foreign investment; and (c) where foreign collaboration (financial or technical) is considered necessary.

That private foreign capital has an important role to play in the country's economic development has been recognized by the Government of India as is reflected in its various policy announcements made from time to time. In fact, a specific provision was made in the Third Plan

---

\*The Survey Report on Foreign Collaboration in Indian Industry published in 1968 by the Reserve Bank of India contains comprehensive details of imports of know-how and managerial skills by the Indian Industry.

for an inflow of Rs. 300 crores of private foreign capital as part of the external resources required for the Plan. Table VI gives a broad idea of the magnitude and the trends in the private foreign capital inflow during 1956-1966

The main points that emerge from the data shown in the Table are that though the level of gross inflow during 1962-66 is somewhat higher than in 1956-61, it has shown wide fluctuations; that the gross outflow has been higher, and that as a result, net inflow representing net transfer of resources to the country has been lower and uneven.

**Accent on Exports:** In the final analysis, country has to pay for its imports in terms of exports. In a sense, this pattern of exchange is symptomatic of the economic maturity of a country. Indeed, there is no doubt that if there is a choice between paying for imports through current exports or through foreign loans, the former is much to be preferred, if only because foreign loans entail a large and recurring liability which has to be met over a period of years in terms of additional exports. Since the amount that a country can currently export is a function of, among other things, the absolute size of its current production, a poor country suffers from a severe limitation on both the size and the growth of exports. India has been no exception to this rule.

In order to understand the policies which India has adopted for getting over some of the chief obstacles to increasing exports, it may be useful to indicate very briefly the main problems in the field. The limitations of the absolute size of the country's total production relative to its population has been already referred to. Again, while in a country where per capita real incomes are extremely low, a certain increase in consumption per head is virtually unavoidable on humanitarian grounds; and such an increase, however marginal, superimposed on a rapidly growing population involves both a rise in imports and an adverse effect on the export availabilities of many items of its output.

Further, costs in a growing economy are often high, at least initially, owing to various factors, such as sub-optimum scales of production, the high cost of capital and of technical skills, high transport costs and often, inefficiency. These costs tend to decline at higher scales of production and with the growth of factor supplies.

There are, however, some more deep-seated problems to be faced by an underdeveloped country trying to increase its exports. As a rule, each such country has a traditional export pattern made up of raw materials with which it has been endowed by nature. Tea, jute, cotton, oil-seeds, mineral ores are the kind of things which India has been exporting for a very long time. Some of these items have also been processed into semi-manufacture or manufactures and been exported. The scope for expanding the exports of such traditional items suffers from many

\*Revised.

\*\*Largely due to petroleum companies.

N.B. 1. Figures exclude foreign investments in banking and insurance companies.

2. The inflow has been computed, wherever possible, by eliminating valuation changes.

3. Individual figures may not add up to totals because of rounding up.

4. In view of the shift in the assessment period from calendar year to financial year it has not been possible to indicate the inflow/outflow during 1962-63.

5. Data for 1963-64 to 1966-67 include foreign private loans and suppliers' credits for which information was not available in the earlier years.

6. Changes in the branches' net position which were shown hitherto in the previous assessment upto 1962 on a gross basis are now appropriately shown on a net basis under inflow; profits of branches are deemed to have been distributed.

7. Retained earnings figures upto 1962 are inclusive of retained earnings of branches; and for the subsequent period these relate to Controlled Rupee Companies as profits of branches are deemed to have been distributed.

handicaps. As the manufacturing industries grow, the domestic demand for their product goes up and less is available for export. Countries already industrialized, which have their own industries of a similar kind, adopt protective policies to limit the volume of imports from developing countries. Last but not the least, advances in technology keep on providing new synthetic substitutes for natural raw materials. The prospect of expanding the traditional exports is, therefore, severely limited.

The attempt to diversify exports by producing new articles is equally frustrating. As a rule, new industries set up in developing countries do not have the advantages of scale of production, which industries already established in more advanced countries have. The high cost of capital and of technical skills also makes it difficult to export in competition with the industries of the more advanced countries. While a newly established industry can enjoy protection in the domestic market as an infant industry, any attempt to overcome the handicap of initial higher costs in export markets is apt to meet various obstacles. It is not surprising, therefore, that many developing countries in formulating their plans for development concentrate on industries which will help to reduce imports rather than industries which will help to increase exports.

When the Third Five Year Plan was being formulated, a determined effort was made to provide for a substantial increase in exports. As mentioned earlier, the target for the total export earnings of Rs. 3,700 crores has in fact been achieved, the actual realizations being Rs. 34 crores higher than this figure. The annual performance has been as follows:

TABLE VII  
Exports of F.O.B.

| Year    |    |    | U.S. \$ Million |
|---------|----|----|-----------------|
| 1960—61 | .. | .. | 1,324           |
| 1961—62 | .. | .. | 1,404           |
| 1962—63 | .. | .. | 1,430           |
| 1963—64 | .. | .. | 1,684           |
| 1964—65 | .. | .. | 1,683           |
| 1965—66 | .. | .. | 1,546           |
| 1966—67 | .. | .. | 1,535           |
| 1967—68 | .. | .. | 1,673           |
| 1968—69 | .. | .. | 1,823           |

In contrast to the virtual stagnation in exports during the first two Plans, the export performance during the Third Plan was satisfactory. The increase in the first three years of the Third Plan was the result of a rise in quantum as well as unit values of exports, diversification of the commodity pattern of exports and penetration into new markets. The pause in exports during the last two years of the Third Plan was due to

the decline in agriculture-based items of export (e.g. cotton and jute textiles) in the wake of shortages of raw cotton and raw jute. In 1966-67 however, exports declined sharply owing primarily to the severe setback in agricultural output, and to some extent due to the downtrend in international prices of primary products.

The more recent trends in Indian exports bear out that the new export policy initiated in the wake of devaluation of the Indian rupee has had its impact and that the decline in exports in 1966-67, the immediate post-devaluation year, was due to factors extraneous to the new export policy. An important aspect of the export performance since 1967-68 is the basic change brought about in the commodity pattern of Indian exports by the new export policy which has for its basis the development of non-traditional export items. The improvement in the export levels of non-traditional commodities was more striking than the overall increase in exports. The main non-traditional exports, such as engineering goods, iron and steel, iron ore and chemicals which totalled \$ 175 million in 1965-66 rose to \$ 347 million in 1968-69. Between 1960-61 and 1965-66 these items had increased from \$ 93 million to \$ 175 million. Exports of engineering goods increased from \$ 37 million in 1965-66 to \$ 92 million in 1968-69; iron and steel rose by \$ 79 million to \$ 105 million; and chemicals showed an increase of 39 per cent to \$ 32 million. The earnings from iron ore rose by 33 per cent to reach a sizeable level of \$ 118 million reflecting partly the enhanced role of state trading in the exports of iron ore. On the other hand, the major traditional items, such as jute manufactures, tea and cotton textiles have shown declines between 1965-66 and 1968-69 due to high raw material costs and keen external competition. Thus, the spurt in exports in 1967-68 and 1968-69 was largely due to the rapid growth of exports of non-traditional items which in turn is attributable to the new export strategy devised in 1966-67 to make the devaluation of the rupee effective. The indications are that the rising trend in exports, particularly of non-traditional items, may continue.

#### IV. Conclusions

Scarcity of foreign exchange has in fact been the pivotal difficulty in economic planning in India. The realization of this has progressively grown since the latter half of the Second Five Year Plan. India does not have perfect or even approximate domestic substitutes for some of the foreign products needed to carry out the investment programmes. At the same time, the secular demand for India's major commodity exports, such as jute and tea appears sluggish, that for minerals and other raw materials, volatile, while exports of such products as steel and light engineering goods can be expected to improve substantially over a very long period of time. While India must strive hard as it has been doing

to develop exports as also invisible foreign exchange earnings, clearly it will require some substantial continuing inflow of foreign assistance in the next decade or so.

Given its natural endowments and size, India has it within its capacity to achieve a viable self-sufficiency within a reasonable spectrum of time provided adequate external resources are made available in the meanwhile. The hey day of foreign aid in India was reached during the formative period of the Third Plan. Outlook for adequate foreign assistance flows, however, varies, as could be expected, from time to time. The labours of the Second United Nations' Conference on Trade and Development held in New Delhi early in 1968 do not seem to have been as successful in regard to the quantum of developmental assistance flows as the developing countries, including India, hoped for. These changes in aid outlook have, of course, to be taken in stride by the developing countries even though the lower the size of the flows the farther the prospects of achieving self-reliant growth recede in time. India would certainly strive to do so.

There are also two aspects of aid flows which merit attention irrespective of their size in case of most developing countries and certainly in case of India. First, whatever the quantum of external aid, it should be so available that it can be used in such an efficient manner that it contributes to the development of the recipient economy to the optimum level. This implies that the time taken in putting through a specific investment and bringing it up to the productive stage is reduced to the minimum from the point foreign assistance is arranged for the purpose. We have earlier referred to the considerable delay in the early part of the Third Plan in aid utilization and the subsequent measures taken to improve the position. Efficiency of foreign aid from the recipient's point of view is also affected by the aid being tied as to source. It is estimated that source tying involved a reduction in the real value of aid and, therefore, in its productive potential in relation to the quantum of assistance given, of between 12 and 13.5 per cent in case of Pakistan in 1960-63. For Tunisia, the direct cost of source tying of the United States assistance in 1965 has been put on a conservative basis at 20 per cent. Indeed, in respect of the total global assistance extended by the United States in 1965, aid tying to purchases within the United States put up the prices of aid-financed commodities 17 per cent above the world market prices. To the extent that the assistance is in the form of loans, there is a further effective deduction in the real value of aid in that the servicing payments are proportionately higher in relation to the real aid received.

The second aspect demanding immediate favourable action on the part of those who provide assistance relates to the terms on which assistance is given. India's own position in regard to debt servicing has

already been referred to. Prospects for exports from aid receiving developing countries, including India, are not too bright even on the most optimistic assumptions. The debt service burden on these countries must, therefore, be significantly reduced as soon as possible. India has fortunately already started receiving relief on this score from some of her aid givers to meet her immediate difficulties. Over the longer term, however, not only must there be substantial reduction in the interest charges and in the annual repayment instalments but the proportion of the loans in the total external resources inflow needs to be drastically reduced. It would not be improper to recall here that what was given after the World War II to the economies in Western Europe — with all their fund of sophisticated technological, entrepreneurial and other organizational skills and destruction only of their physical capital — to effect their reconstruction, was Marshall Aid. As much as 95 per cent of it was extended as grants and only 5 per cent as loans. The loans also involved very liberal terms as to interest and repayments. They had a maturity of 35 years and carried interest at  $2\frac{1}{2}$  per cent per annum payable annually, but without interest payments for the first  $3\frac{1}{2}$  years from the inauguration of the programme at the end of 1948. The amortization payments began in July 1956, *i.e.*, 4 years later still, and it was still provided that postponement or alteration or other modifications in the loan terms could be affected by mutual agreement if adverse economic conditions prevailed in any country. The total amount involved in this exercise of U.S. magnanimity after World War II was no less than \$ 13.6 billion, \$ 12.5 billion of which in grants and only \$ 1.1 billion in loans. Annual disbursements amounted to \$ 6.1 billion in 1948-49, \$ 3.8 billion in 1949-50, \$ 2.3 billion in 1950-51, \$ 1.4 billion in 1951-52, at which levels they worked out to 2.3 per cent, 0.4 per cent, 0.8 per cent and 0.4 per cent of the gross national product of the U.S. in the respective years. Before the inauguration of the Marshall Aid programme, the U.S. and Canada agreed in 1945 to lend as much as nearly \$ 5 billion to the U.K. repayable in 50 equal annual instalments with a grace period of 5 years and interest charge of only 2 per cent per annum, with the additional proviso of an automatic waiver of interest payments in any year in which the U.K. found itself suffering from the balance of payments difficulties. If advanced countries require such massive flows with such overwhelming grant element to recoup losses caused by war largely to their physical capital alone, surely India and other developing countries need and should be given even more liberal treatment in the matter of external assistance if they are to provide socially tolerable levels of growth for their very poor populations.

The current trends in aid, however, are not encouraging. In the closing years of the first development decade, the volume of foreign official aid has been stagnant as is borne out by the fact that the quantum of aid

has not kept pace with the growth of national product in the rich nations. The doubt has now arisen whether the developed nations will continue to provide assistance to developing countries at all. There seems to prevail in the rich countries a spirit of disenchantment with aid; with the result that the very purpose and feasibility of aid seem to be in question. This is partly due to the misconceptions and unrealistic expectations on the part of developed countries in regard to the duration of the development process; and partly due to the feeling that developing countries have not been making proper use of aid. There has also been a lessening of support for genuine development aid due to the increasing complexity and urgency of domestic problems in the aid giving countries.

There has been a similar feeling of disenchantment in the developing countries as well, though for different reasons. In the developing countries, there are signs of frustration and impatience and a measure of disillusion about the very nature of aid relationship. Development was often regarded in these countries as a continuation of the political struggle and as a result, the elimination of foreign rule was expected to open up avenues for early and easy prosperity. The nature of obstacles in the way of development and the kind of decisions required to be taken to overcome them were not always understood. Thus, for instance, the need for export growth was underestimated while agricultural development was usually neglected.

Donors as well as recipients tended to expect too much too soon from aid as a supplement to the national development effort. Modernization and development of low income countries were viewed by both the donors and recipients as an attempt to repeat the Industrial Revolution with the result that too much attention was focussed on individual investment projects rather than on the causes and results of slow progress. It also became clear that while aid givers were particularly interested in whether recipients made efficient use of resources placed at their disposal, such interest often gave rise to friction, misunderstanding and mutual irritation. Viewed in this context, the present donor = recipient relationship does not seem viable for any length of time and a more purposive attitude to foreign aid is called for. Aid for development means more than a simple transfer of funds. It means a set of new relationship which must be conceived as an exercise in co-operation and partnership.

The publication by the World Bank of the Pearson Commission's Report which is appropriately called "Partners in Development", was timely. The Commission on International Development was set up by the World Bank in August 1968, under the chairmanship of Lester B. Pearson to review the impact of external assistance on the development of poorer nations over the past two decades, to identify the reasons for its success or failure and to evolve a long-term strategy for aid with a view to enlarging the flow of development finance — bilateral and multi-

lateral. The Commission in its Report submitted to the World Bank President in September 1969, has made a series of far-reaching recommendations for increasing the flow of resources in the seventies from developed to developing countries. The more important of these recommendations are: (i) official development assistance be raised to 0.7 per cent of each donor country's Gross National Product by 1975 and in no case later than 1980; (ii) aid funds should be made available for periods of at least 3 years to ensure continuity in the flow of aid; (iii) reduction in the interest rate, lengthening of the maturity periods and progressive untying of aid; (iv) liberal use of long-term debt rescheduling and refinancing; (v) World Bank lending should be made available at subsidized interest rate to the developing countries suffering from growing debt burden; and (vi) substantial increase in the resources of the International Development Association. The extent to which these recommendations will be implemented depends largely on the developed nations — their attitude to development aid, their approach to the general problem of economic development and the spirit of co-operation and partnership they are inclined to display in this great endeavour.

## CHAPTER XV

# RENTS AND WAGES

The endeavour is to examine the behaviour of rents and wages in the Indian economy in recent times, and to reflect upon the forces that determine rents and wages in the socio-economic context of this country. To the extent data are available, the analysis will be quantitative in character and the degree as well as the direction of change will be sought to be determined. But apart from this, some qualitative aspects of rents and wages and the mechanism for the control of rents and wages will also be discussed. Though the analysis relates generally to the post-independence period, and particularly to the era of planning, beginning with the year 1951 and spreading over India's first four Five Year Plans, occasional comparisons with the pre-independence period are also undertaken.

The study is divided into four parts, Part-I dealing with agricultural rents, Part-II with non-agricultural (urban) rents, Part-III with non-agricultural (industrial) wages and Part-IV with agricultural wages. The treatment of rents and wages whether in the agricultural or the non-agricultural sector cannot obviously be exhaustive, for, even as rents are of numerous varieties and pertain to several types of property, wages are of many categories and apply to several levels and grades of labour. It is not possible to deal comprehensively with the behaviour of rents for all manner of agricultural and urban property — land in its several varieties, residential accommodation of various categories and premises used for non-residential purposes, such as office accommodations, shops, warehouses and hospitals, to name leading categories. Nor is it possible to give a very exhaustive treatment of the wages of agricultural and industrial workers divided as these workers are into numerous grades which are differentiated on the one hand by the levels of earnings and technical skills and, on the other, by types of occupation — manual and mental, skilled and unskilled — and types of industries — traditional and modern, public sector and private sector. An attempt, however, is made to analyse the rents of the dominant categories of lands and buildings in the agricultural and the urban sectors, and the wages of the main categories of workers, particularly organized workers, in the industrial sector and the generality of workers in the agricultural sector. In studying rents and wages, one has to be conscious that one is dealing with the rewards of two important factors of production, rents being the turn on the ownership of property, for allowing its use by others, and wages being the reward to workers for giving their labour. Interest earnings, which are the reward for allowing the use of one's capital by

someone else, and profits, which are deemed to be the returns to ones entrepreneurial skill, risk-taking and successful operation of business, are the other major rewards to productive factors and are dealt with elsewhere.

## A. RENTS

### I. Agricultural Rents

The nineteenth century, for the first time, brought a situation in India in which land became a valuable asset to hold in order to earn rents as distinct from being used for agricultural purposes to obtain income from the process of cultivation. This emergence of land as a valuable rent-yielding property was obviously due to the growth of population and the consequent growth of towns and the opening-up of the new channels for trade and communication in the country-side through the development of the railway, the emergence of ports, etc. The pre-nineteenth century phenomenon of an unlimited supply of land in relation to a meagre population thus came to an end and the demand for land, for the first time, began to exceed the supply then available, making it necessary for those who wanted to use land to pay rents to landowners. The problem of high rents in agriculture first noticed on a wide scale in the nineteenth century, became a country-wide phenomenon in the first half of the twentieth century and the demand for rent reduction became a major objective of social policy on the part of reformers, intellectuals and the national leadership. The adverse supply position in relation to demand led landowners to step up rents, evict tenants from time to time, indulge in rack-renting and thus cause great hardship to the tenantry. Peasant disturbances quite often had their roots in these phenomena of rack-renting and evictions and land-hunger grew quite seriously. These tendencies began to manifest themselves so sharply by the 1940's that, as soon as independence was secured, the land reform movement took a very definite shape and brought immense pressures to bear upon various administrations in different parts of the country to frame comprehensive land legislation for security of tenure on the one hand, and for the reduction and subsequent abolition of rents on the other.

**Factors Determining Agricultural Rents:** After the beginning of the era of planning, most State Governments under the guidance of the Planning Commission and the Central Government framed comprehensive legislations for rent reduction and other land reforms. By this time, the demand and supply situation with respect to land had become quite acute. Land is an asset whose supply cannot be increased readily. Irrigation and reclamation programmes are not easy to administer and the resources

required to bring additional lands under the plough are generally very large and often beyond the reach of small peasants. Even so, recent estimates show that between 1951 and 1961, grass-cropped land increased by about 16 per cent, thanks to reclamation, irrigation and double-cropping. This was, no doubt, a very welcome feature at a time when the demand for land was growing very rapidly owing to a population growth of 21.5 per cent and an income growth in real terms of about 4 per cent over the decade. By all accounts, the increase in the demand for land was faster than the additions to supply, with the result that the market value of land increased phenomenally while rents, which represent the price to be paid for the use of land, also showed considerable increase. An additional factor which kept land-hunger or the demand for land growing very rapidly was that new jobs in the non-agricultural sector, though increasing by more than a million each year, were not increasing fast enough to cause a net shift of the population from the agricultural to the non-agricultural sector. The pressures of agricultural populations on agricultural land continued unabated and, in fact, increased further, with the result that agricultural rents had a built-in tendency to increase quite rapidly. The economic forces of demand and supply were bound to bring about generally increasing rents in all sectors and no less so in the agricultural sector.

**Land Reforms and the Mechanism for Agricultural Rent Control:** It was in the face of these economic forces which tended to push up rents that the attempt of the land reform movement to reduce the burden of agricultural rents must be appreciated. The main planks of land reforms in almost all the States of this country were (a) security of tenure for all those tenants who had been cultivating lands for, say, five years; (b) reduction of rent burdens wherever these were shown to be excessive; (c) the right on the part of the tenant to purchase the land from the landowner at a price generally lower than the "free" market price of land and thus relieve himself of the rent burdens altogether. Legislations, of course, varied from State to State, but, by and large, wherever the tenant cultivator and the landowner agreed to the customary or the prevailing levels of rent, the executive authority allowed these rents to prevail and did not interfere. But wherever a tenant found the burden of rent to be excessive, he could resort to Revenue Courts. Revenue officers would then revise the rent at such a level that it was no more than  $\frac{1}{4}$  to  $\frac{1}{3}$  of the value of the gross produce of the farms. There were, however, several exceptions. To illustrate, until recently, the State of Tamil Nadu permitted the landlord's share in the produce to be as high as 60 per cent while the tenant cultivator only got the remaining 40 per cent. This was revised later, but even in the revised set-up, tenants continued to pay 25 per cent to 40 per cent of the

produce as rent depending upon whether the landowner did, or did not, contribute farm capital to the operation of the farm.

Under the celebrated Zamindari Abolition Act of the State of Uttar Pradesh — the first comprehensive reform of its kind in this country — an occupancy tenant (a permanent and hereditary tenant) had two options. He could continue to pay the rent of land but pay it to the Government rather than to the absentee landowner who was, of course, given a compensation in order to forego the ownership of the land. Alternatively, the occupancy tenant, could pay as a lumpsum a value equivalent to 10 times the annual rent or, in instalments, a sum equal to 12 times the annual rent and, thus, acquire the ownership of land. As soon as the payment was completed, the burden of rent was reduced by half; the remaining half was deemed to be land revenue and was received by the State.

In erstwhile States, such as Bombay, Hyderabad and many others, a tenant-cultivator, who had occupied the land for some years and was described as a permanent or a protected tenant, could venture, within prescribed limits, to buy up land from his landlord by paying about 8 to 10 times the annual rent. This multiple of rent actually worked out to be much less than the market value of the land and by buying up land so cheaply, it became possible for the tenant to acquire ownership rights and avoid further rent payment. After the acquisition of ownership right, the new owner did not pay rent but only paid land revenue which was a mere fraction of the old rent. The India Land Reform Movement thus aimed at the abolition of rents altogether in course of time, as tenants acquired full ownership rights or as owners resumed their lands from their tenants, within prescribed limits, for personal cultivation. Thus, there was to be a return to peasant proprietorship and an elimination of the superfluous layers of non-owning, rent-paying cultivators and non-cultivating, rent-collecting, absentee landlords. Only one payment, namely, land revenue -- paid by the owner-cultivator to the Government — was to survive and rent, which was an intermediary payment from the tenant to the landlord was to be abolished.

It is interesting to note, however, that the tenantry in this country did not generally take full advantage of the measures to reduce rents of agricultural lands or of the measures enabling tenant-cultivators to purchase their lands and have rents abolished. Less than 20 per cent of the tenant-cultivators went to the Revenue Courts and pleaded for rent reductions. It was perhaps in the nature of things that owing to the great shortage of land and the increase in land-hunger, the bargaining position of tenants should be compromised seriously. Moreover, in day-to-day life the lot of the tenant is tied with the landlord at many points, and the social relations existing in Indian rural society did not make it easy for tenant to plead openly against their landlords and ask for rent reduction.

Even so, what land reforms could not achieve in a big way in terms of rent reduction, inflation and the growth of productivity between 1951 and 1965 appear to have achieved quite successfully. The point is that rents in Indian agricultural society are fixed in three different ways: rents are settled in terms of so many tonnes of produce per hectare or in terms of so many rupees per hectare or, indeed, as such and such a percentage, say, 30 per cent of the produce. In the first category, the absolute rent which is a given number of tonnes per hectare could not be reduced. But even so, the increase in productivity per hectare made the existing rent a smaller percentage of the increased produce and, thus, reduced rent burdens per hectare. In the second instance, where rents were fixed as so many rupees per hectare, the growth in the productivity per hectare and, more so, the increase in the price of the product, considerably enhanced the value of the product from every hectare of land; and so the given number of rupees fixed as rent came to be a smaller proportion of the value of the produce and constituted a smaller burden. Only in the third category, where rents were fixed as a percentage of the produce, did an increase in the volume and/or the value of the produce result in a simultaneous increase in rents and no alleviation of the rent burden. These are share-crop rents, and it is precisely in this type of rent fixing that the tenantry suffered heavily.

**Share-Cropping Rents:** The discovery on the part of landowners that the adoption of share-cropping arrangements and fixing rents as a percentage of the produce was an excellent way of dodging many important planks of land reform, appears to have led to an increase in subtle share-cropping arrangements whereby the actual tenant is not formally recognized as tenant but is only deemed to be a farm servant. There is either a servant deed made between him and the landlord or, indeed, there is no deed at all but a mere oral lease. This arrangement at one stroke nullifies all the rights of the tenant—the right to security, the right to have rents reduced and the right to purchase the land of the landowner within specified limits and, thus, save himself from excessive rent payment. From all accounts, the area under this kind of share-cropping tenancy is not only large, but has been on the increase lately. A recent study by Ladejinsky in five districts of India in different States confirms this belief. Ladejinsky finds rent burden among share-cropping tenants in the Tanjore district of Tamil Nadu to be between 60 and 66 per cent in numerous cases. Other districts like West Godavari, Ludhiana and Shahbad are not very different in terms of high rent payment and subtle tenancy arrangements. An offshoot of excessive rents obviously is the reduction in the incentive to cultivate land with improved techniques and with a greater intensity of investment per hectare. Moreover, share-cropping tenants, burdened with excessive rents and with no record of the lease, find it very difficult to

obtain loans from co-operative and other organizations, public and private and at best secure very meagre quantities of credit.

In order to reduce the burden of oppressive and exploitative rents and give to the share-cropping tenants their due rights under tenancy reform, including the right to fair rent, the most important thing is to identify these tenants who are often camouflaged as farm servants. The real test of their identity will be whether in addition to giving their labour they are also contributing working capital or fixed capital to the farm. For, if they are contributing capital and not merely labour, the presumption ought to be that they are, in fact, tenants and not merely wage labourers. In that case, their tenancies should be forthwith recorded, the security of their tenure guaranteed, their rents reduced to a 'fair' level and their right to purchase the lands which they cultivate should be granted. Such an identification of share-cropping tenants is by no means an easy matter, as the approach of each single farm hand has to be individually made. Luckily, the population Census of 1961 included in its schedules questions about people's right to the land they occupy and the area so occupied. It turned out from the census data that about 23 per cent of India's total cultivated land is under one form of tenancy or another. As the land openly declared to be under tenancy cultivation in the village papers and in the Censuses of Land Holdings (conducted in the middle of 1950's) works out to be about 12 per cent, it would appear that the additional 11 per cent or so of land area stated in the population Census of 1961 to be under tenancy arrangements is under concealed share-cropping tenancies. On this additional 11 per cent of area, agricultural rents are obviously very high and several studies are available to show that these rents range between one-half to two-thirds of the value of crops produced.

In order to be able to identify the tenants individually, enter their titles in the Record of Rights in the village and have rents subsequently reduced, it has been suggested that a committee be formed at the village level. This committee might deal with one or a few villages and could consist of representatives of tenants, of landowners and of the tenant-cum-landowner category. It is probably better to add to this group a Government representative, preferably of the Land Revenue Department, inasmuch as the presence of this official might help in the maintenance of the proper perspective and prevent politics from dominating the decisions of the committee. Once a tenant is identified and his rights recorded, rents can be reduced to fair levels — about 1/4th to 1/6th of the value of the produce.

Just as a large percentage of permanent or protected tenants who could have taken advantage of the provision of rent reduction, have not, in fact, taken this advantage, so also the right of the tenants to purchase the land at less than the market price has not been adequately utilized.

This seems surprising at first sight, especially when land is said to be a very crucial asset for which there is great demand both on economic and social grounds and when the abolition of high rents automatically follows as soon as ownership rights are acquired by tenants. On detailed consideration, however, there seems to be some justification for the tenants not taking advantage of the right to purchase. The new ownership which such a purchase will grant is not the same as the old one; that is to say, the new right is hedged with many qualifications insofar as one cannot mortgage or sublease one's land, nor use it for non-agricultural purposes, nor, indeed, add to it easily owing to ceiling limits on future acquisitions. Secondly, even though the new ownership rights can be acquired relatively easily by paying only, say, 10 times the annual rent, it requires the amassing of some capital and one has to go out of one's way to do so. And finally, there is a general feeling among protected and permanent tenants that if the new law has already given security, permanency and hereditary rights, there is no particular reason to acquire formal ownership especially since capital has to be amassed and since existing rent burdens, for one reason or another, have already become tolerably low.

**Magnitudes of Agricultural Rents:** Thus, on about one-fourth of the agricultural land surface, tenancy cultivation with rent payments seems to continue; of this about half the area would appear to be subject to rather excessive rent payments, ranging anywhere between 40 to 66 per cent of the value of the produce, while the other half, which comprises recorded tenancies, pays relatively low rents which may well be between one-sixth to one-fourth of the value of the produce, in some cases, slightly more.

In order to give an approximate idea of the rents paid for leasing-in agricultural lands in different parts of the country and in different size groups of farms, we produce from the Farm Management Studies conducted by the Ministry of Food and Agriculture, Government of India some data in Table I about rents and their relation with the value of output. It is noteworthy that generally rents per acre decrease as the size of holding increases. This suggests -- and there is other evidence too to support this contention that in larger holdings bad land constitutes a greater share. That output per acre declines as holding size increases also suggests the correctness of this hypothesis. Since both rent and gross output decline per acre with an increase in holding size, and decline more or less in the same proportion, rent as a percentage of output has no tendency to increase or decrease with holding size.

But the regional variation in rents per acre and also in rents as a percentage of output are quite remarkable and land reforms do not seem to have brought about much regional equality. In the dry tracts of

erstwhile Bombay, for instance, rents are between Rs. 6 and Rs. 18 per acre and constitute between 10 and 20 per cent of output. But in the wet areas of Andhra Pradesh rents are as high as Rs. 150 to Rs. 210 per acre and amount to as much as 40 to 60 per cent of output. In the two selected districts of erstwhile Madras rents range between 20 and 35 per cent and in the Punjab between 30 and 40 per cent of output.

TABLE I  
Rents Per Acre and as Per Cent of Gross Output Per Acre by Size of Farm

| <i>State/Size of holdings<br/>(in acres)</i> | <i>Mean size<br/>of<br/>holding</i> | <i>Rent*<br/>per acre<br/>(in Rs.)</i> | <i>Gross output<br/>per acre<br/>(in Rs.)</i> | <i>Rent per acre<br/>as per cent of<br/>gross output<br/>per acre<br/>(3 as % of 4)</i> |

(\*) Estimates of rents are by Dr. C. H. Hanumantha Rao of the Institute of Economic Growth and are based on the *Studies in the Economics of Farm Management* undertaken by the Government of India.

## II. Urban Rents

In this section the rents of non-agricultural lands, (generally urban lands) and of buildings, both residential and non-residential, in urban areas are dealt with. Not only the levels of rents and their recent rates of change, but also the factors influencing these levels and rates, the machinery for controlling rents and the degree of success in the operation of this machinery are discussed.

It is important to note that the rent of land, being the price to be paid for the use of land, depends upon the supply of land and its demand, the latter being derived from the use to which land is put. The main use of urban lands, of course, is for building purposes and, therefore, the rents of urban lands must in the ultimate analysis be related to the returns from buildings, whether of a residential or a non-residential character. Thus in large metropolitan centres where the supply of land for building is very limited but the demand for building is extremely heavy, the result is a more intensive use of building, a tendency to increase the number of storeys in each building, and an increase in rent per unit of space. The total rent of the building on any given area of land increases by leaps and bounds and this in turn enhances the rents of lands on which these buildings are constructed. Thus the real explanation of the rents of urban lands is to be sought in the rents of buildings constructed on these lands and hence land rents are seen to be a derived phenomenon.

The crucial factors in recent times which have raised the demand for buildings and hence their rents, as also the rents of urban lands, are the dual phenomena of population growth and urbanization. India's population which used to grow at a rate much less than 1 per cent per annum before 1921, registered between 1921 and 1951 a growth rate of about 1 per cent per annum, thanks to the decline in the death rate consequent upon the control of infectious and contagious diseases and the control of famines, etc. Side by side with this, a colossal process of urbanization manifested itself as a result of many important factors such as industrialization, lack of job opportunities in rural areas, concentration of war-time industries in cities and post-independence migration of displaced persons. This process was at its peak between 1941 and 1951 and the rate of urbanization during this decade had no parallel in the history of this country. The ratio of urban population to total population which was only 13.9 per cent in 1941 increased to 17.3 per cent in 1951, the rate of urbanization (defined as percentage variation in the percentage of urban to total population) working out to be as high as 24.6 per cent. Between 1951 and 1961, the ratio of urban to total population only rose from 17.3 to 18.0 per cent, the rate of urbanization being only 4 per cent compared to 24.6 per cent in the previous decade.

Even so, the increase in urban population in absolute terms was quite alarming, the decennial rate of growth — both from natural sources and from migration from the rural to the urban sector — working out to 41 per cent in 1941-51 and about 35 per cent in 1951-61.

The period from 1941 to the present times has thus seen an unusual growth of towns and cities. Urbanization is caused partly through the emergence of new towns where there were no towns before and partly by the addition to the size of population centres. Thus, villages become small towns, small towns grow into large towns, large towns become cities, cities grow into major cities and these in turn develop into vast metropolitan centres. An increased density of population in urban areas which urbanization brings about, causes the demand for buildings for all purposes to rise sharply in relation to their supply. Rents of buildings are pushed up remarkably in the process and this in turn has its impact on the rents of lands on which buildings are constructed. The saving factor, however, is that additional lands can be converted from agricultural to urban uses and this additional supply tends to keep the prices and the rents of urban land rather lower on the peripheries of the growing towns and cities than in the centres. Were it not for this fact of availability of agricultural lands for urban purposes, urban rents, both of lands and buildings, would have been much higher than what they actually have been.

Even as the rent to be derived from buildings and lands in urban areas grows, the price of buildings and lands, which reflects the capitalized value of rents, grows accordingly. One of the outstanding features of the last decade or so has been an abnormal increase in land values and in the value of buildings.

Phenomenal increases in the rents of urban lands and buildings are bound to cause great hardships, both to tenants who want residential and other accommodation and to many buyers of premises and of land who constantly find the prices of property rising above the limits of their purse. Salary-earners, professional workers and those with relatively fixed incomes, find it increasingly difficult to acquire property while a tight demand situation relative to supplies enables landlords to evict tenants, increase rents and cause serious inconvenience.

**Urban Rent Control Machinery:** Most State Governments faced with this phenomenon during the Second World War and thereafter, had devised ways and means for rent control. The control mechanism applied generally to rents of buildings in large and medium sized cities, but did not exist, for all practical purposes, in small towns. The most common method applied is that rents prevailing on or around a certain date, for a given living space of a defined quality, are accepted as "fair" rents; and landlords, under control orders, are expected not to raise the

rents of their premises from time to time. The rent control machinery also prevents evictions of tenants except (a) on grounds of non-payment of rent, (b) on grounds of damage or misuse of property, and (c) if the owner of the building wishes to use the building for his own personal requirements (provided there is ample proof that he does not have alternative accommodation and genuinely requires his own building).

By and large, in large cities rent control has been a great boon to millions of tenants, who otherwise would have found the ruling "free" market rents quite intolerable. But rent control cannot be said anywhere in the country to be an unqualified success and has in fact been seriously abused in many cases. Changing tenants, raising rents of new tenants — and indeed of existing ones — under threat of eviction, acquiring the possession of buildings on the plea of personal use and letting them out after a while to other tenants at higher rents, demanding a special payment called a *pagri*, which is the price for vacating an occupier and admitting a new occupier in the premises are fairly well-known abuses in cities like Bombay, Calcutta, Delhi and Hyderabad and indeed in smaller cities and towns. Even when the rent control order is enforced rigorously, new and subtle ways of dodging the control are discovered. While the rent for the building might formally be stated in the lease deed to be a controlled rent quite acceptable to law, additional rent is charged on the grounds that the premises are furnished or certain items of equipment are provided. This, in the majority of cases, is just a method of charging extraordinarily high rents by showing the value of furniture and equipment etc., to be much higher than it actually is. Not only do rent increases occur owing to excessive demands by the landlords in many surreptitious ways but many a tenant, finding himself in a pitifully weak bargaining position and faced with an absolutely impossible situation regarding accommodation, readily accepts rent increases, and so the process continues.

In certain cities like Delhi, after 1947, accommodation was in extremely short supply compared to the demand which got augmented owing to extraordinary factors, such as the partition of the country and the tremendous influx of displaced persons. It was argued that in order to boost up the rate of house construction, rent controls should not be introduced; for that might dampen the initiative to construct more buildings at a rapid pace. This near-absence of control no doubt resulted in a rapid expansion but also brought in its train great hardship to middle and lower-middle classes who had to cut down on many essentials of life in order to provide for rent.

*Pagri:* That rents of urban buildings in large cities are not allowed by law to increase, has led to the emergence of many alternative modes by-passing legislation. Some of these modes have already been mentioned.

One of the most prominent devices in large cities has been the *pagri* system. When, for somewhat compelling reason of his own, the tenant has to leave a building, the landlord takes advantage of the opportunity of obtaining a substantial sum called *pagri* to do the favour of letting the building out to the new tenant. More often than not, the out-going tenant himself demands the *pagri* before leaving the building and handing it over to the landlord or to the next tenant whom the landlord would like to accommodate. There is another reason for charging a *pagri*. While accommodating a new tenant the landlord might want to charge him a rent much higher than the controlled rent — that is a rent which the market can bear. The new tenant may cleverly agree to pay high rent and may subsequently go to the rent controller and have his rent reduced to the controlled level. To safeguard against such a contingency, landlords collect an advance payment which is *pagri*. In theory, *pagri* is nothing but the capitalized value of the difference, wholly or in part, between controlled rent and the uncontrolled, free-market rent which equates the demand for buildings with the limited supply. In actual reality, however, there are many factors which do not make this logic come entirely true. The important point, however, is that *pagri* exists and those who wish to acquire control of the premises—whether they be owners who want to get accommodation for their own living or for subsequent leasing or whether they are new tenants — have to pay a rather forbidding sum which taxes their capacities unduly and, in fact, in numerous cases, prevents people from shifting from their present unwholesome apartments to other better ones.

The *pagri* system has been known to exist in the metropolitan cities of Calcutta and Bombay for many years. It did not exist in Delhi, Madras or Hyderabad, but has been emerging quite rapidly in these, and some other urban, concentrations. As many a desperate tenant in search of accommodation is willing to pay either advance *pagri* or advance rent for several months or even years, it has become possible for many a landlords to construct whole buildings with these advance payments.

**Levels of Rent and Other Details in Selected Cities:** Appendix I gives some details about house rents from socio-economic surveys and other studies undertaken in the cities of Bombay, Calcutta and Lucknow. These details, which are illustrative rather than exhaustive, indicate the levels of rents for premises of different types and for different magnitudes of floor space, percentages of occupants in different rent brackets and the relation between rents and incomes.

## B. WAGES

### I. Industrial Wages

Wage being the reward for labour depends, like the reward for any

other input, on its supply in relation to demand. Indeed, the wage rates of any specific category of labour — skilled, semi-skilled, unskilled, etc. — is seen to depend on the supply of and the demand for that category of labour. Factors on the supply side comprehend such matters as the cost of subsistence or of education and training of workers, the agreeableness or onerousness of work, the desire on the part of the workers to offer their labour in the market and the strength of the working class as determined by their collective bargaining position, etc. Factors on the demand side have obviously to do, among other things, with the demand for the commodity in the production of which the particular variety of labour is involved, and the value of additional product obtained by adding one more unit of labour. Actually, the determination of the wages of any given category of workers, as indeed the determination of the general wage rate, has been the subject of great controversy and has led to the development of alternative theories which vie with one another in explaining such issues as the level of wages, the differentials between the wage level of different categories of workers and the rate of change of wages of one category of workers singly or *vis-a-vis* the wages of other categories.

In what follows in this section will reflect upon the level as well as rate of increase of money wage rates (and wherever possible money earnings) of workers as a whole and some specific categories of workers for which data are available. We also examine the change in some other important variables with which wages must be linked up if a fruitful casual analysis is to be conducted. Periods of economic development are characterized by inflationary tendencies during which both prices and wages move upwards. In such periods, it is essential to know whether wages have been catching up with prices or have been falling behind. To be able to examine this, the rate of increase of money wages or earnings has to be seen in the context of the rate of increase of the general price level, in particular, the price level of working class consumer goods, if an idea of change in the real earnings of labour is to be obtained. Here, not only are the earnings of all workers, but also of particular categories of workers of interest. While some workers may have beaten the price line by having their wages stepped up rather rapidly, others may never have caught up with prices and might have ended up as net losers in the bargain. This may be particularly true of unorganized workers who have no simple mechanism for having their earnings stepped up in line with rising costs of living. It may also be true of salary earners and professional workers whose earnings are generally known to be more sluggish in their upward march, though perhaps sticky in their downward movements. Thus, taking price increases over the period as a norm, one has to compare the relative increase in the wages of important categories of workers for which data are available.

Yet another meaningful comparison is between the rate of increase of wages on the one hand and the rate of increase of earnings of other factors of production such as land, capital and entrepreneurship. Such a comparison obviously reflects upon the relative position of the working class *vis-a-vis* the owners of property, such as lands and buildings, the owners of other forms of capital and the captains of industry who are the recipients of profits. In a country which has aimed in all its developmental plans at a more and more equitable distribution of the national product between various classes and factors of production and whose policy is consciously geared to an increase in the share of the down-trodden and the weaker sections of the community, particularly wage workers, it is important to ask how the relative share of factors of production, especially the share of labour, has altered.

And finally, there is the major issue of the differentials between the earnings of different classes of workers or workers in different occupations.

**Changes in Money Earnings:** Table II reveals a comparison between money earnings per factory worker and national income per head at current prices over the decade 1951-1961. It would appear that money earnings per worker had increased roughly from 100 to 138 over the decade, *i.e.* by a little more than  $3\frac{1}{2}$  per cent per annum while per capita income in the same period increased from 100 to 122, that is at an average annual simple rate of about 2.2 per cent. Factory workers, therefore, would seem to have improved their money earnings over this decade not merely in absolute terms but also *vis-a-vis* an average member of the Indian society and this is quite understandable in the case of organized workers. What is not so certain is whether unorganized workers in the country, whose earnings cannot rise as rapidly as those of the organized working class, were able to show a gain in one sense or another.

TABLE II  
Trends in All-India Average Annual Money Earnings Per Worker  
and Per Capita National Income

| Year | Average annual money<br>earnings per factory<br>worker (1951-100) | Per capita national<br>income at current<br>prices (1951-52-100) |
|------|-------------------------------------------------------------------|------------------------------------------------------------------|
| 1952 | 107                                                               | 97                                                               |

Table III gives the average annual money earnings of factory workers (earning less than Rs. 200 per month) between 1947 and 1960, separately for most States of the country and, indeed, for the country as a whole. Similar data for 1961 to 1969 are available in Table IV, but for workers earning less than Rs. 400 per month. These data are seen in Tables V and VI in the form of an index with base as 1951/1961. Annual percentage rates of change in the money earnings of factory workers drawing less than Rs. 200/400 per month have been worked out in Table VII and are seen in columns 3/5. It would appear from this Table that in the years prior to 1961 money earnings in Mysore (Karnataka) and Andhra Pradesh recorded the fastest rate of increase (7.3 and 5.5 per cent per annum respectively) among all States; Madhya Pradesh, Madras (Tamil Nadu), Orissa and West Bengal registered an annual percentage increase between 3 and 5; Bombay (Maharashtra) and Uttar Pradesh between 2 and 3 per cent; while Assam, Bihar, Punjab and Delhi registered figures ranging between zero and 2 per cent per annum. Rajasthan was the only State to register a negative rate, that is, a slight decrease in average annual earnings at a rate of 0.8 per cent.

During the period 1961-69, on the other hand, a remarkable similarity emerges in the rate of growth of money earnings of factory workers, among all the States of the country. The highest rate (for Kerala) and the lowest rate (for Bihar) are as close as 11.38 per cent and 10.46 per cent per annum and all other States cluster between these two figures. The mechanism for collective bargaining through trade unions and allied machinery and the transmission of the demands of organized workers all over the country appears to have acquired extra-ordinary efficacy during this period. Without this hypothesis of quick transmission and standardization in practices for raising and setting wage demands, it is difficult to explain such a remarkably close convergence of the rate of increase of earnings all over the country.

It is also possible to obtain from existing data the average *daily* earnings of factory employees who draw less than Rs. 200/400 per month. Tables VIII and IX give these daily earnings for all the States of the country in each of the years 1956 to 1961 and 1961 to 1968. Concentrating on the year 1961, it turns out that the highest level of daily earnings of factory workers is found in Gujarat (Rs. 5.1), Maharashtra (Rs. 4.9) and Delhi (Rs. 5.0). Bihar, West Bengal, Madras (Tamil Nadu) and Uttar Pradesh show figures ranging between Rs. 4 and Rs. 5, while Andhra Pradesh, Punjab, Mysore (Karnataka), Orissa and Rajasthan record figures ranging between Rs. 3 and Rs. 4. Earnings of factory workers seem to be the lowest in Assam, Himachal Pradesh and Kerala and range between Rs. 2.4 and Rs. 3 per day.

On the other hand, the position in 1968 was as follows:

Maharashtra and Madhya Pradesh recorded the highest average daily earnings of organized factory workers — above Rs. 9 per day and were closely followed by Delhi and Gujarat. At the other extreme, while Tripura recorded an unduly low figure of Rs. 2.73, Jammu and Kashmir, Andhra Pradesh, Rajasthan and Punjab had daily earnings between Rs. 5 and Rs. 6, all other States clustering between Rs. 6 and Rs. 8.

**Changes in Real Wages:** While the behaviour of money wages and earnings over time and space is interesting in itself, an even more meaningful question is whether organized workers were able to record any improvement in their levels of living in real terms, that is to say, whether an increase in wage rates was higher or lower than the increase in consumer prices.

Table X enables us to compare the changes in the index of money earnings between 1951 and 1960 with changes in all-India consumer price index. If the base of these indices is taken to be 100 in 1951, it turns out that money earnings of factory workers earning less than Rs. 200 per month rose under the impact of the Korean War from 100 in 1951 to 107 in 1952 and stayed more or less at that level for 3 years. This was so in spite of the fact that these were generally years of falling prices and of a general relaxation in the inflationary atmosphere as a result of the end of the Korean episode; and indeed years of a relative abundance of food owing to very good weather conditions and the bumper harvests of 1953-54 and 1954-55. That money earnings did not decline in spite of a decline in consumer prices shows in part the stickiness of wages and earnings. The period between 1951 and 1955, therefore, was one of real improvement in the conditions of the organized working classes. The index of their real earnings (col. 4 of Table X) increased from 100 to 123.7. After 1956, the position began to worsen somewhat, for while earnings rose at a somewhat slow pace, all-India consumer prices rose from 91.4 to 118.1, i.e. by 29.2 per cent in the course of the Second Five Year Plan. Real earnings, therefore, decreased from 123.7 in 1955 to 111.3 in 1960. But even so the level of real earnings in 1960 was 11 per cent higher compared to 1951 and over the whole decade the organized working classes could be said to have improved their position somewhat.

Table XI, however, confirms that real earnings of the working class which, as shown earlier, started decreasing from 1956 onwards, continued to decrease during the 1962-69 period. The index of real earnings (col. 4) stood at 98 in 1969 (base 1961=100) having in fact dipped to lower levels — 95 and 91 in 1966 and 1967 respectively. There is thus some evidence of near-stagnation, in fact a slow worsening of the organized working class position over nearly a decade and a half.

Source: Indian Labour Statistics, 1967, 1971.

Inflation had taken its full toll and it can be discerned that the unorganized working classes may not have done much better in respect of real wages per worker, whatever other gains they may have obtained.

The improvement noticed in the real wages of the working class in the country as a whole during 1951-61 seems to have been shared by every region of the country.

Table XII reflects upon this. Here is a comparison of changes in money wages per worker with changes in real wages among workers of different States. If 1951 were taken as 100, it would seem that in almost every State the index of wages rose faster than that of consumer prices, leaving the workers everywhere better off in real terms as seen in column 5 of this Table. To illustrate, in the State of Assam, money wages rose between 1951 and 1961 from 100 to 132 while consumer prices, in fact, declined somewhat from 100 to 98, thus making the workers better off in real terms; so much so that the index of real wages rose from 100 to 135 over the decade. Taking yet another illustration, this time from West India, it can be seen that in the State of Bombay, money wages rose over the decade by 32 per cent while consumer prices rose only by 17 per cent, thus resulting in an increase in real wages by about 13 per cent or roughly 1.3 per cent per annum. There is no exception in any of the States to this trend towards improvement in real wages and the level of living judged by these data seems to have gone up everywhere among organized but low-paid working classes. However, it is not established that there was much improvement in the decade 1961-1971 as we shall soon see.

While one must not lay too much stress on State-wise comparisons from the data given in Table XII alone, it can be stated that the fastest increase in real wages per worker was recorded in the State of Orissa (100 to 163 over the decade) and the next fastest increase in Madras (including Andhra Pradesh) (about 50 per cent over a decade). Bihar registered an increase of 39 per cent, Assam of 35 per cent, Punjab of 27 per cent, West Bengal of 19 per cent and Bombay of 13 per cent over the decade.

**Wages in Relation to Other Factor Payments:** As indicated earlier, the point of interest lies not only in estimating whether or not wage rates rise faster than consumer prices, but also whether they rise more or less fast than the money earnings of other factors of production such as interest on capital, profits of entrepreneurship, rents from property and salaries and earnings of professional workers. Table XIII enables us to reflect, at any rate partially, on this important phenomenon of changes in wages relative to the earnings of other factors of production. It will be seen that if 1952-53 were taken as 100, the average annual money earnings of factory workers drawing less than Rs. 200 per month, rose to

Source: Indian Labour Statistics, 1962.

\*Figures for 1958, 1959, and 1960 do not include those from Madras (including Andhra) as the latter are not available and hence are not strictly comparable. Figures for 1959 for Madhya Pradesh have been repeated for 1960, as those for 1960 are not available. If estimated indices for Madras (including Andhra Pradesh) are taken into account, the combined indices for all States submitting returns for 1958, 1959 and 1960 would be 121.4, 124.0 and 132.9.

*Source:* 'Labour Bureau' as quoted in the Indian Labour Statistics — 1962.

\*This excludes figures from erstwhile State of Madras including Andhra Pradesh, and hence these are not strictly comparable with figures for the previous years. If estimated figures for these States are taken into account the indices of money earnings for 1958, 1959 and 1960 would be 121.4, 124.0 and 132.9 respectively and those of real earnings for the three years would be 109.9, 107.6 and 112.5 respectively.

TABLE XI

## Index Numbers of Real Earnings of Employees in Manufacturing Industries and Mines

Source: Indian Labour Statistics, 1963 (as given in the Reserve Bank of India Bulletin, April 1964, p. 439).

126.6 by 1961-62, that is to say at an average rate roughly of 3 per cent per annum. As the wholesale price index over the same period had risen by 23 per cent, that is, at an average rate of 2.6 per cent per annum,

the real earnings of workers could have been said to have increased over this period.

The same, however, cannot be said of real earnings of factory workers during the 1960s. Taking 1961-62 as 100 (as in Table XIV) the index of wholesale prices rose to about 180 in 1969-70. But the index of money earnings of factory workers (earning less than Rs. 400 per month) increased only from 100 to 166 in the same period. The organized workers thus did not, on the whole, beat the inflation of prices. However, this statement is more true in the early 1960s than in the later half of that decade. After the outbreak of the wheat revolution around the mid-1960s the price rise came under control until the outbreak of war with Pakistan in 1971. During this interregnum alone did the organized workers manage to get a higher real wage as a class.

But while these results refer to the earnings of organized workers, it may safely be presumed that unorganized workers, who hardly have an institutional mechanism for having their wages stepped up, had a smaller rate of increase of their earnings than 3 per cent per annum. Similarly, the real earnings of salary earners some of whom also do not have an obvious mechanism for wage increases while others have, but are not expected to utilize it fully — as is the case with civil servants and the army or the police force — most certainly rose at less than 3 per cent per annum.

In like manner, judging by columns 6 and 11 of Table XIII and columns 5 and 10 of Table XIV it is possible to say that in comparison with organized wages, interest earnings on Government bonds also rose less fast over these two decades, the crude annual rate of increase of interest being only about 2.27 per cent in the 1950s and about 2.24 per cent in the 1960s. And finally, the price index of variable dividend industrial securities (company shares) which reflects in many senses the fortunes of the business community, including the profitability of enterprises, rose from 100 in 1952-53 to about 193 in 1961-62, that is, a rise of about 10 per cent per annum. In the following 9 years the index with base 1961-62 as 100 remained virtually unchanged in 1970-71.

The period of two decades under consideration, clearly falls into two sub-periods. In the first sub-period upto 1962 profit earnings and rents of urban property rose much faster than the wages of organized workers, a phenomenon which might have been expected in an inflationary period, such as India was going through since 1954. It is also clear that while rentiers and profit earners were easily able to beat the increase of prices and step up their real incomes as well as their money incomes by a big margin, organized workers were only just able to keep pace with the cost of living. But from 1962 onwards when profits begin to stagnate and Government bonds virtually pay negligible returns, the relative earnings of workers increase even though the working class is not able to overcome the rapid rate of price inflation until the beginning of the agricultural

TABLE XIII  
Rates of Change in Prices, Wages, Profits and Interest: 1952-64

| Year    | Prices              |                                      | Wages                                                                                |                        | Profits                                           |                         | Interests                                             |                   |       |                                      |

transformation.

As the most of workers in the society may be taken to be unorganized in the present stage of India's development, it is, perhaps, fair presumption that these unorganized workers, at any rate outside the agricultural sector, were not able to keep their head above the rising tide of prices and suffered some decline in real earnings. At best their purchasing power managed to keep pace with the cost of living and at worst declined "somewhat". This also seems to be the reason why, over the first 15 years of planning, the increase in India's real national income, and more so in per capita real income, has not been either marked or very noticeable. The average rate of increase of per capita real income has been of the order of  $1\frac{1}{2}$  per cent per annum. It is worth reflecting upon that not everybody in the society clusters around the average rate of growth, and that the average improvement is made up of a rather spectacular improvement in the fortunes of some and a less than average improvement, or even a decline, in the real standard of living of others. The analysis given above has tended to show that only profit earners and rent earners have experienced a growth of their earnings faster than that of other groups and, indeed, faster than the rate of increase of prices. But rent-earners and profit-earners are too few and the general feeling of prosperity or adversity cannot be the resultant of what happens to their earnings alone. It is the mass of the working class whose real earnings are likely to decide whether the community as a whole feels better off or not. And here we have seen the result that organized wage earners alone have managed to beat the price line to some extent, while the mass of unorganized workers, salary earners and some professionals have either not managed to keep pace with the price increase or have, in fact, fallen behind in the race for higher money and real incomes.

The only other major category of great importance among working classes is that of agricultural workers. The changes in the earnings of this group *vis-a-vis* some other factors have been examined later in this chapter (Section IV). But it may be mentioned here in passing that there are two categories of workers among agricultural wage earners — those who derive their incomes partly from cultivating the bits of land which they hold either as owners or as tenants; and those who are landless agricultural labourers receiving a wage. It is the first category of workers who also do some cultivation of the soil who could not have suffered much during the inflationary era inasmuch as they obtained a part of their income in the shape of agricultural commodities. The fact that the prices of these commodities were rising nearly all the time did not affect them adversely at all and to the extent they consumed these commodities directly they did not have to buy these in the market at ever-increasing prices. As a matter of fact, the situation affected them favourably, for they sold these commodities at steadily increasing

prices. The decline in the real value of their cash earnings from labour which followed price inflation was partly or wholly off-set through the gain they made as producers of agricultural commodities. It is only in the case of the landless agricultural labourers that the possibility of a decline in real wages over the decade in question cannot be ruled out. It is true that some of them got their wages in kind and, to that extent again, they were cushioned against the impact of inflation. But wages in kind have increasingly lost ground in recent times owing to the rapid process of monetization of the economy that has been in progress. The employers of labour increasingly desire to fix wages in cash rather than in kind as inflation reduces the burden of cash payments. And workers themselves desire cash payments in order to buy urban-industrial goods with cash. Thus cash payments are becoming the rule in a large number of cases and account for a very large part of wages. Inflation did eat into the value of these cash payments. Insofar as the prices of commodities such as mill cloth and kerosene which agricultural workers purchase with their cash earnings kept on rising all the time and in some parts of the period rose at a rate faster than the prices of agricultural commodities — landless wage workers have lost some ground during the inflationary period. The only way in which inflation could have been prevented from having an adverse effect on landless agricultural cash-wage earners was to have the money wage rate itself stepped up faster than prices. From all accounts, this does not seem to have happened. A comparison of the wage rates in 1950-51 and 1956-57, which emerges from the First and the Second Agricultural Labour Enquiries, in fact, reveals a decline in the money wages of agricultural workers and signifies a deterioration in living standards. This finding, of course, has to be qualified. But more will be said on this in the following section dealing with agricultural wages.

**Composition of Earnings:** The earnings of workers in India consist of several categories. The basic wage — which may be related to the time on work, or may be a piece wage — is of course, the main component of earnings and varies between 50 and 90 per cent of total earnings of organized workers. Only an occasional instance may be found of the basic wage consisting of less than 50 and 90 per cent or more than 90 per cent of all earnings. But in addition to the basic wage, workers receive cash allowances of various sorts which go up to as much as 45 per cent of gross earnings; bonuses which have a range of variation from very small figures to as much as 15 per cent of gross earnings; and finally, certain other concessions whose money value may be negligible in many cases, but in some is found to be as high as 10 per cent of earnings. Table XV and XVI enable us to see for the years 1961 and 1967 not only the proportion which each of these earnings constitutes of the gross

TABLE XV  
Average Per Capita Annual Earnings of Employees in Manufacturing Industries Earning Less Than Rs. 200 Per Month

| States                          | Gross Earnings    | Basic Wage       | Cash Allowance | Bonus         | Money value of concessions | Arrears      |

Source: Indian Labour Year Book — 1968

earnings at the all-India level but also the State-wise differences in these proportions. It is clear that in 1961, the per capita yearly earnings of the lowest-paid categories of employees in manufacturing industries was Rs. 1,425 on the average. Moreover, the manufacturing workers being an organized category, with trade union contacts between one region and another and with labour laws and wages regulations cutting across State boundaries, the range of variation in their per capita earnings does not seem to be very large. If the lowest figure for per capita earnings of an average worker in the factory establishments was Rs. 1,111 (in Punjab), the highest figures (for Gujarat and Maharashtra respectively) were Rs. 1,617 and Rs. 1,605, that is to say, less than 50 per cent higher than the lowest figures, all other States showing figures within this range. If the average per capita earnings of an employee in the manufacturing establishments was 100 at the all-India level, the basic wage constituted a little over 61 per cent, cash allowances a little more than 34 per cent, bonuses a little more than 3 per cent, payment of arrears about 8 per cent and money value of concessions less than half of 1 per cent of all gross earnings. In 1961, the variation in the percentage which basic wage constituted of gross earnings is found from Table XV to be between 49 per cent for Madras (Tamil Nadu) and 91 per cent for Punjab. In 1967, this variation is seen from Table XVI to be between 43 per cent for Gujarat and 90 per cent for Punjab. But in general, the basic wage is quite close in all States to the all-India average. As for bonuses, Uttar Pradesh seems to be the only State with bonuses amounting to less than 1 per cent of gross earnings in 1961 and less than 2 per cent in 1967. Punjab and Haryana, too, have a small figure between 1 and 2 per cent. All other States have bonuses generally amounting to between 2 and 7½ per cent, the States with highest bonuses in relation to earnings being Madras (Tamil Nadu) and Kerala in 1961 and Tamil Nadu and Maharashtra in 1967. Cash allowances of various sorts are the lowest for Punjab, being about 6½ per cent of all earnings in 1961 but in general range between 20 and 40 per cent of earnings, only Madras (Tamil Nadu) and Gujarat showing figures around 43 per cent. In 1967 Assam alone shows substantial (5.6 per cent) cash concessions, all other States having figures of around or below one per cent.

While we need not be get involved here in a detailed discussion of the levels and the rates of change of earnings of various categories of workers, such as those in coal mines, other mines, plantations, etc., we give in the Appendix II (Tables A, B, C, D and E) further details about these levels and rates of change over time for different sub-categories of workers.

**Occupational Differences in Wages:** One crucial dimension of the wages of working classes ought to be highlighted. A very important way of

looking at wage rates is to differentiate between wages of workers in different occupations. In a developed society, thanks to communications, trade union organizations, Government policies and demonstration effects, wage rates in different occupations for workers with similar skills or onerousness of work tend to become equal. Other things being equal, wages also have a tendency to equate themselves with the marginal productivity of labour in different industries subject, of course, to some very important qualifications.

Tables F and G of the Appendix II give some details of the wages in different occupations and the variations in those rates over time and among different States. Table XVII gives the average annual earnings in various occupations for the year 1950-51, both in terms of rupees and as a percentage of net output per occupied person. This would seem to be an interesting way of looking at earnings. It turns out that if the net output per occupied person in 1950-51 amounted to Rs. 665 at current prices, the annual wages of agricultural workers were no more than Rs. 306 on the average, while the annual earnings of rural skilled labourers were at least double that level, *mochis* and cobblers showing an average earning of Rs. 596, blacksmiths of Rs. 722 and carpenters of Rs. 765. Mine workers came out slightly worse off, coal miners receiving an average annual earning of Rs. 364 and those in non-coal mines getting Rs. 522. School teachers were no better paid than skilled labourers, such as carpenters and blacksmiths had showed an annual earnings of Rs. 769 on the average. Industrial workers (drawing less than Rs. 200 per month), in fact, turned out to be the best paid category, their average earnings being Rs. 967 per annum. It is clear that if the net output per occupied person in the country as a whole were taken to be 100, the earnings of industrial workers were almost  $1\frac{1}{2}$  times that level, those of teachers and rural skilled labourers only slightly more than the output per person, while mine labourers showed earnings between 75 per cent and 96 per cent and agricultural labourers only 46 per cent of net output per occupied person.

TABLE XVII  
Average Annual Earnings In Various Occupations

(1950-51)

| S. No. | Occupation                | Annual earnings (Rs.) | Per cent of net output per occupied person |
|--------|---------------------------|-----------------------|--------------------------------------------|
| 1.     | Agricultural wage rate    |                       |                                            |
| 1.     | Field labour              | 300                   | 45.1                                       |
| 2.     | Other agricultural labour | 306                   | 46.0                                       |
| 3.     | Agricultural operations   | 302                   | 45.4                                       |

(3) *Education in India*, Vol. I., 1964-65.

The rates of change in the earnings of various occupations at current prices between 1950-51 (equals 100) and 1960-61 are seen in Table XIX. While net output per occupied person rose from 100 to 126.8, factory employees had their earnings stepped up by 44 per cent, mine workers by 100 per cent, railway workers by 37 per cent, Central Government employees, including railways, by 27 per cent, plantation workers by more than 45 per cent and rural skilled workers by about 23 per cent.

Two interesting relationships emerging from Table XIX are noteworthy. The higher the level of earnings of any category of workers, the less rapid has been the rate of increase of its earnings over time. Central Government servants, including railway workers, had the highest level of average earnings (Rs. 1,692 per annum) in 1960-61. It is precisely in their case that the rate of increase of earnings over a decade is the slowest (27%). Railway workers have a level of earnings of Rs. 1,624 per annum and the rate of increase (37%) over the decade in their case is somewhat higher. Factory employees have a level of earnings (Rs. 1,376 per annum) lesser than railway workers and Central Government employees and the rate of increase in their case has been as high as 44 per cent over 10 years. Mine workers have earnings even lower than those of factory employees and the rate of increase in their case is nearly 100 per cent over 10 years. Thus, by and large, the tendency for workers with higher levels of earnings to show a slower rate of increase and those with lower level to show a faster increase results in a process of levelling up of the weaker sections of the society and tends to bring about equality among earnings of different occupations.

As distinct from this remarkable tendency, the other noteworthy feature of Table XIX is that plantation workers and rural workers despite very low levels of earnings, have not been able to show faster rates of increase over time and this is more true of rural workers than of plantation workers. Thus, there is a tendency for disparities between rural workers and others to grow, while there is the opposite tendency for disparity within the non-agricultural categories of workers to diminish.

**Wage Policy:** As employers are not always conscious of even the irreducible minimum requirements of wage earners and often take refuge behind the argument of lack of capacity on the part of the enterprise to pay a decent wage, it has become necessary to make and implement a wage policy. Despite unfavourable wage conditions, the Government of India and the State Governments have been conscious of the need for a wage policy which prevents unduly low rates of remuneration and bad working conditions in sweated industries. The concepts of minimum wage, fair wage and living wage have been invoked from time to time and the contents of these concepts have been spelled out on numerous occasions. The Payment of Wages Act was passed

TABLE XIX

Scattered information is similarly available for the period 1961-70 from various sources. Some of it is presented in Table XVIII and is suggestive of differences in earnings of different occupations and sectors.

in 1936 and attempted to guarantee that wages will be paid at an interval not exceeding one month; that they will be paid not later than the 7th day of the month; and that no deductions will be made from wages except those authorized by the Act, such as a deduction for fines for notified act of omission, for absence from duty, for actual loss or damage to goods, for house accommodation and other amenities provided as a term of employment and for recovery of advances or adjustment of over-paid wages. The Labour Investigation Committee in 1944, the Industrial Disputes Act of 1947, the Tripartite Committee on Fair Wages of 1948 and the Minimum Wage Act of the same year are some of the landmarks in the evolution of a decent wage policy. Several State Governments have also appointed from time to time, inquiry committees and Wage Boards whose work has brought substantial benefits to the working classes. The scope of the Minimum Wages Act has been extended to more and more sweated industries, beginning with industries like *shawl* weaving, rice, flour or *dal* mills, tobacco manufacturing, plantations, stone breaking, tenancies, etc. Minimum time rates, piece rates and overtime rates for different occupations, localities or classes of work have been fixed from time to time. It has been provided that workers may either receive a basic wage and cost of living allowance, or, a basic wage with or without cost of living allowances and the cash value of concessions in respect of essential commodities supplied at concessional rates, or, indeed, a wage rate which includes all these. In all the various committees, sub-committees, advisory boards, etc., appointed by various Governments from time to time, it has become customary to have representatives of the employees, the employers and the Government. While all these are positive steps, uniformity in the standards of minimum wage fixing or, for that matter, in other aspects of wages has not emerged to the desirable extent in the different regions of the country. Different principles with emphasis on different aspects continue to be the cause of a bewildering variety of wage rates. Nevertheless, within a State, and quite often over different States, assemblance of uniformity has been slowly emerging in wages for comparable occupations, intensities of work, skills, etc. The awards given by the Labour Courts, Industrial Tribunals and Conciliation Courts have no doubt helped the healthy tendency towards standardizing wage rates and ensuring equal pay for equal and similar work.

## II. Agricultural Wages

The mode of determination of agricultural wages, their levels and the rates of increase are obviously very different from those of industrial wages. This is so owing to several peculiarities of agricultural wage-labour in the context of an under-developed country with a seriously adverse land-man ratio. In India, the rapid growth of population

between 1921 and 1951 at an annual rate of about 1 per cent per annum and an even more rapid rate of increase at about 2.2 per cent per annum since 1951 has increased the pressure of population on agricultural land which has not been expanding by any significant extent. If only opportunities for the absorption of agricultural workers in non-agricultural operations were abundant, a reduction in the ratio of manpower to land or a slower rate of increase in this ratio could have made things a little more manageable. However, while job-opportunities in the non-agricultural sector have been emerging by the millions in every Five-Year Plan period — they are emerging much too slowly and are being filled by the existing supply of workers from the categories of unemployed and under-employed within non-agriculture, from increased labour participation, and finally, from the natural growth of the non-agricultural population. The agricultural labour force, itself growing at a rapid rate of more than 2 per cent per annum, has not been finding enough opportunities to get absorbed fully. Even before the era of planning such was the great mass of labour force and of population dependent on agriculture that not only was per capita income or output small but a serious degree of under-employment — both seasonal and all the year round — was in evidence. It has been argued that under these circumstances of surplus labour force and under-employment, the marginal productivity of labour tends to approach zero or may even become negative in extreme cases. That is to say, many a farm has workers who may not be adding anything to the total product. If these workers were withdrawn from the farms where they worked in too much of a cluster, the output of the farms would not diminish. As output would not diminish, the presumption is that the workers who were withdrawn were under-employed, although if they were asked whether they were doing any productive job, their answer would probably be that, in fact, they were. It follows that one of the peculiarities of under-developed and over-populated agriculture is that judging by the subjective feelings of workers, these workers are employed, but that, judging by the objective test of whether they are really essential to the work and are adding to the total product, many of them will be found to be redundant.

This situation of serious labour surplus in the agricultural sector all over the country, barring perhaps a few pockets of labour shortage, existed even before the era of planning began in 1951. Recent indicators show quite convincingly that things might have even worsened somewhat over the last 15 years. It is true that gross acreage under cultivation has increased by about 20 per cent since 1951 (including irrigated acreage). A greater intensity of cropping and the adoption of techniques which utilize more labour has also been in evidence. Even so, the demand for agricultural labour cannot be said to have

kept pace with the supplies from natural increases of labour force and indeed from the increased desire for participation in work, particularly among women. One may, therefore, presume that the degree of under-employment, in all probability, has increased somewhat in the agricultural sector particularly because major possibilities of shifts of agricultural workers into non-agricultural occupations have not yet emerged, although they might emerge in the near future in a big way. Even before 1951 there was a great deal of under-employment of agricultural labour. But suppose that we assume that there was no backlog of unemployed labour; even then it follows that the 4 million or so jobs created during the First Five Year Plan did not absorb all those who came additionally to the labour market to seek jobs. In like manner, while the Second Five Year Plan created about 7 million additional jobs, job-seekers during that period probably increased by 12 to 14 million. In both Plans, then, fresh under-employment among agricultural workers emerged in the economy. The Third Five Year Plan aimed at creating about 12 million jobs, but by all accounts, there was an under-fulfilment of targets in this respect as in some other fields. The number of job-seekers on the other hand continued to increase phenomenally at a faster rate so that the Fourth Five Year Plan is estimated to begin with a backlog of 12 million under-employed or unemployed workers and will add some 23 million more to the labour force. Of these 35 million, it can hope to absorb only about 16 million additional workers in the non-agricultural and about 5 million in the agricultural sector, so that Fifth Plan might begin with a backlog of some 14 million unemployed or under-employed. Under these circumstances, when millions of new jobs created in non-agricultural sector are not found sufficient to absorb fully the new job-seekers within the non-agricultural to the non-agricultural sector remains an academic one, for some time to come. One is, therefore, strengthened in the belief that agricultural under-employment has been growing nearly all the time during the era of planning, despite the creation of millions of job-opportunities in the non-agricultural sector and despite increased demand for labour in the agricultural sector.

In this set-up it was but natural that wage rates in agriculture should not rise or rise much too slowly. And this is precisely what seem to have happened. We have already seen in the previous sections that the rate of increase in the wages of rural skilled workers between 1951 and 1961, has been far slower (a little more than 23 per cent) compared to the rates of increase of other workers (railway workers about 37 per cent; factory workers about 44 per cent; mine workers about 100 per cent and plantation workers about 45 per cent). Apart from the rate of increase, the absolute level of earnings of rural workers, even of the skilled category, is seen to be much lower than in the case of other categories (see Table

XVII); and this too is obviously the result of the supply of agricultural labour being much larger relative to demand than in the case of other workers. As a result of these factors the relative position of agricultural workers *vis-a-vis* other workers has been deteriorating, the only exception to this statement being those agricultural workers who also own lands and cultivate these. As part of their earnings are non-wage earnings and come from the cultivation of land — a business whose fortunes have not behaved badly since the beginning of the Second World War — these land-owning workers have probably not lost very much in the bargain and might have even gained grounds. It is the landless agricultural workers who emerge as the worst hit amongst almost all recipients of wages.

**The Agricultural Labour Enquiries:** The First Agricultural Labour Enquiry was conducted by the Government of India in 1950-51 and the Second Agricultural Labour Enquiry in 1956-57. While a comparison of wages, earnings, employment, etc., of agricultural workers between these two years is not very easy to make in view of changes in definitions and procedures between the two enquiries, a fairly clear picture of the relative position of agricultural workers is available separately for each of the two years for different operations and indeed in different areas of the country. Table XX gives the average daily wage of casual agricultural labourers in 1956-57, both for men and women, working in different operations and in different regions of the country. The daily wage for men in non-agricultural rural occupations was 167 *paise* and this compared with an agricultural wage of 96 *paise*. Operation-wise, while ploughing fetched a daily wage of 100 *paise*, transplanting fetched 111 *paise*, harvesting 93 *paise* and weeding 88 *paise*. In the case of females, non-agricultural operations fetched a higher wage — 62 *paise* per day — compared to the agricultural wage of 59 *paise* per day. Sowing for women appeared to be the most remunerative of operations, fetching 82 *paise* daily; transplanting was the next best, fetching 69 *paise*, while harvesting and weeding brought 58 and 52 *paise* per day respectively.

For males as well as for females, agricultural wages turned out to be the highest in Punjab, the average daily wage in 1964-65 for men being 198 *paise* and for women 122 *paise*. Assam, West Bengal and Kerala also recorded generally higher daily wage rates for men compared to other States while Madhya Pradesh and Orissa recorded the lowest figures (76 and 80 *paise* respectively).

As stated already, a comparison of wages between the First and the Second Labour Enquiry, that is to say, between 1950-51 and 1956-57 is made extremely difficult owing to changes in definitions and procedures. If one were to go by simple uncorrected results, it would appear that the average daily wage rate of casual male agricultural labourers

TABLE XX  
Average of Daily Wage of Casual Agricultural Labour During 1956-57

\* Assam includes Manipur and Tripura and Punjab includes Delhi and Himachal Pradesh.

declined from 109 *paise* to 96 *paise*, that is, by 12 per cent and for females from 68 *paise* to 59 *paise*, that is, by 14 per cent. As a consequence, the average annual income of agricultural labour households also seems to have decreased from Rs. 497 to Rs. 437 and the per head annual income from Rs. 104 to Rs. 99.4. There are other indicators too of a worsening in the position of agricultural workers between the two years under discussion. The proportions of agricultural labour households with land seems to have decreased from 49.9 per cent to 42.9 per cent; average annual consumption expenditure of agricultural labour households appears to have increased from Rs. 461 to Rs. 617, strangely enough without a simultaneous increase in income. In consequence thereof, the percentage of agricultural households in debt seems to have gone up from 45 per cent to 66 per cent, while the accumulated debt per household also seems to have increased from Rs. 47 to Rs. 88.

These results, against a wholesale acceptance of which the reader must be seriously warned, have to be subjected to rigorous scrutiny as, indeed, they have already been in Indian economic literature.\* A great deal of analysis has established the point that if corrections were made for definitional and procedural changes between the two Enquiries, the comparative position of agricultural labourers in 1956-57 could not be said to have been any worse than in 1951. The decline in incomes was the result not of changes in the actual reality, but largely of the elimination of households with relatively high incomes which, under the new definition, could not be classified as agricultural labourers. It was also the result, quite substantially, of using the wholesale price index for evaluating the kind incomes of agricultural labourers in 1956-57, when, in fact, the retail price index (which happened to be about 10 per cent higher) was used for a similar evaluation in 1951. It turns out after close examination that the average number of days worked during the year increased for men by 2.6 per cent and for women by 9.2 per cent in agricultural operations. But this increase in employment or the demand for labour could not match the somewhat faster increase in the supply of labour between 1950-51 and 1956-57. In the result, under-employment perhaps increased somewhat and wage rates understandably decreased by 4 per cent for men and by as much as 13 per cent for women between 1950-51 and 1956-57. It is this faster decrease in the wage rates of women that perhaps made it a little more remunerative to employ women in preference to men, wherever such substitution was possible. The net result was, therefore, a greater increase (9.2 per cent) in the average number of days worked during the year by women compared to a smaller increase (2.6 per cent) in the number of days worked by men.

---

\* *Agricultural Labour in India*, Ed. V.K.R.V. Rao, a publication of the Institute of Economic Growth, Asia Publishing House, 1962.

The Ministry of Labour has continued to compile statistics of average daily earnings of agricultural labour households on the model of Table XX presented earlier. For the year 1964-65, these statistics are presented here in Table XXI.

**Minimum Agricultural Wages:** While it has been possible for the Government in this country to devise a machinery for at least a partial control of agricultural rents, urban rents and industrial wages, it has not been found easy, under the prevailing circumstances, to set up an effective mechanism for the fixation of minimum agricultural wages. There are several difficulties of an almost insurmountable character — which stand in the way of an effective minimum wage either in money or in real terms. To begin with, the mass of agricultural labour is phenomenally large, agricultural labour households numbering about 16.3 million in 1956-57 and the population of these households amounting to about 72 million. Within the agricultural labour class, the landless category itself is very large, accounting for no less than 9 million families and about 40 million population. Landless labourers thus constitute about 57 per cent of all agricultural labourers and about one-sixth of agricultural population. This last mentioned figure is quite extraordinary for probably no country in the world has such a large mass of agricultural population deriving its livelihood from wage labour. Even in a thickly populated country like China, agricultural labourers never became so numerous in relation to agricultural population or total population. Apart from the difficulty of numbers, regional disparities in India are so enormous that a minimum wage to cater to the needs of each region is beset with difficulties of its own. The norms for fixing minimum wages for agricultural labourers are not clear. Even in theory while wages of workers in other sectors and lines of industry may have some relation with the marginal product of labour, *i.e.*, the value of additional output due to the employment of one more worker, practically no relation is said to exist between agricultural wage and the marginal product of labour in the agricultural sector. The point typically made in theoretical economic literature is that in agriculture quite often the marginal product is so small (or even negative) that a wage equal to the marginal product will certainly not suffice for the worker and his family to keep body and soul together and would be even below the subsistence level. Wages in agriculture, it is said, are not determined in a country like India with reference to the marginal product, and it seems a better hypothesis to say that agricultural wages are either related very roughly to the subsistence level or are equal to the average farm product, *i.e.*, the total farm output divided by the total number of workers. (We shall presently note some important rebuttals of these statements in the context of the 1960s and the 1970s as distinct from the 1950s).

TABLE XXI  
Average Daily Earnings of Agricultural Labour Households 1964-65

The agricultural wage fixing machinery can, therefore, at best, find it feasible to allow for a minimum subsistence wage which is generally higher than the marginal product of labour. But even a subsistence wage is not an easily definable term, inasmuch as the content of subsistences is too vague and depends a great deal upon personal discretion, subjective feelings and value judgements. Should subsistence include only inferior cereals or superior cereals too? Should children's education, which is deemed to be social necessity and has a constitutional directive to support it, be regarded as an essential part of subsistence? What quality of housing, fuel and clothing should be provided for? There is no one answer to these questions and hence minimum wages are not easy to decide upon.

Arbitrary decisions, however, as in so many other cases, could, of course, be taken; but the real difficulty with a minimum wage programme is the difficulty of enforcement. With a great abundance of the supply of labour in relation to demand, and with supplies growing each year faster than demand, agricultural labourers are in a very weak bargaining position. The landless amongst them have no real asset or property to fall back upon. Competition between them for the relatively few opportunities available is bound to keep their wages and their bargaining position very weak. The availability of other workers and indeed of machines, tractors, etc., as substitutes for labour also works in the same direction, so that there is nothing except the fear of law to enforce minimum agricultural wage. And law, unsupported by other social and economic forces, is indeed not an effective guarantee of enforcement.

The possibility of minimum wage fixing becomes a reality in those regions of the country where the demand for labour begins to catch up with supplies and eliminates the vast labour surplus. This brings about some competition among employers of labour and begins to force them to follow the law or the regulations about minimum wage. For the country as a whole, minimum wage fixing of an effective character will probably have to wait some more time until the pace of industrialization, by absorbing some of the vast labour surplus in the country-side, pushes up wages somewhat, introduces competition among employers and makes it possible to talk of an effective minimum wage.

Important research work in respect of the agricultural sector undertaken in India after the outburst of the wheat revolution in the northern part of the country in the late 1960s suggests a major structural change in the relationship between agricultural wages and productivity. In fact empirical results for the 1950s itself, when better seeds and irrigation had come to be used extensively but the exotic of high yielding varieties with a lot of fertilizer use had not yet emerged, point out to a much greater rationality among farmers than they have so far been credited with. The works of G. R. Saini for the 1950s and of P. S.

Vaishishtha\* for the 1960s show, farmers do come quite close to a rational allocation of resources. In technical jargon, agricultural labour productivity at the margin is not zero but positive and, what is more the ratio of the marginal products of different inputs correspond quite closely to the ratios of factor costs. All this means that the agricultural scene is rapidly changing and is becoming sensitive to changes in costs, prices and profits. Farming is becoming a business rather than a way of life; and bargaining power is also getting altered radically. Organized trade unions in agriculture — among workers, tenants and small farmers — are a real possibility now and wage fixing in relation to the marginal product of labour is already becoming a reality, as distinct from wage-fixing on the basis of traditional norms or even the average product of labour.

| 1960-61 | 50.77                                                                 | 45.67 | 29.87    | 40.59  | 30.58 | 27.74    |

Source: 'Controller of Emigrant Labour' as quoted in

(a) *Indian Labour Statistics* — 1962.

(b) *Indian Labour Year Book* — 1962.

\* Ends on 30 September

\*\* Cash Earnings exclude money value of concessions.

- N.B. (1) With reference to the above Table a labourer is defined as a person working on wages not receding Rs. 50 per month (excludes a clerk, a domestic servant, or a mechanic, carpenter, mason, brick-layer or other artisans.
- (2) The figures of earnings are based on tea estates submitting returns. The coverage is incomplete and varies from year to year.
- (3) The figures in respect of the years prior to 1953-54 are based on two months' average (March and September), whereas those for 1953-54 and onwards are based on 12 months average.
- (4) The figure for 1958-59 shows a slight fall due to the fact that no prosperity bonus was paid during the year.
- (5) The increase in figures for 1959-60 over the figures for 1958-59 is due to increase in wage rates and the share of prosperity bonus.

**Table E**  
**Annual Percentage Rate of Change of the Earnings of Plantation Workers in Assam (1947-48 to 1960-61)**

| Area                | Annual Percentage rate of change* |
|---------------------|-----------------------------------|
| <b>Assam Valley</b> |                                   |
| Men                 | 9.9                               |
| Women               | 10.9                              |
| Children            | 10.0                              |
| <b>Cachar</b>       |                                   |
| Men                 | 8.8                               |
| Women               | 9.4                               |
| Children            | 9.6                               |

\*Based on regression equation of the type  $\log W = a + bT$  where W is monthly earning and T is year.

Note: Based on data as given in Table D of Appendix II.

N.B. The above figures are in terms of rupees. The Payment of Wages Act covers such factories as are defined under clause (m) of section 2 of the Factories Act-1948. Figures for 1956 exclude those from Karnataka, Kerala, Rajasthan, Himachal Pradesh, and Jammu and Kashmir, for 1958 exclude those from Tamil Nadu, Karnataka, Kerala, Himachal Pradesh and Jammu and Kashmir, for 1959 exclude those from Tamil Nadu, Karnataka, Himachal Pradesh, and Jammu and Kashmir, for 1960 those from Himachal Pradesh, and Jammu and Kashmir. In the figures for 1960, estimated figures of Madhya Pradesh, Tamil Nadu and Rajasthan have been included.

\*Figures exclude those of Assam.

\*\*Provisional and estimated

Source: Indian Labour Statistics — 1963

N.B. The figures have been obtained by dividing the total wages bills by corresponding figures at average daily employment. Figures for average daily employment are as obtained under the Payment of Wages Act and are, therefore, different from those obtained under the Factories Act, 1948. Figures for Andhra Pradesh and Maharashtra could not be included due to late receipt of return.

## CHAPTER XVI

# LABOUR AND EMPLOYMENT

### I. Policy Before and After Independence

Labour in India has made significant strides in recent decades, particularly since the thirties. This has been made possible by the increasing social consciousness among the entire community, assisted by a series of progressive pieces of legislation on labour matters by the Government which, in turn, were due to pressure from the trade union organization. The developments abroad as well as the standard-setting efforts of the International Labour Organization (I.L.O.) have also influenced the shaping of labour policies in India.

Early labour legislation in the country related mainly to the regulation of recruitment, forwarding and employment of Indian labourers under the indenture system to various British colonies, as well as to uncultivated lands and the nearly uninhabited jungles of Assam towards the expansion of the plantation industry in that area. Labour of Indian origin can be found even today in places like Sri Lanka, Burma, Malaysia, Africa, etc. Under the regulatory scheme, the worker was bound by a contract to serve for a specified period, failing which, he could be arrested for criminal breach of contract. The Government, however, prescribed a minimum wage and provided for the protection of labour in certain other respects.

Some attempts to mitigate the serious abuses in the employment of workers in factories were made towards the close of the last century. These again were more from the point of view of protecting the competitive capacity of British products from those of Indian origin where labour was not regulated at all. The Factories Acts, 1881 and 1891, provided for the limitation on the employment and working hours of workmen and children. Between 1875 and 1908, factory legislation was the subject of investigation by four commissions or committees. Most of these investigations led to the amendment of the Factories Act. Similarly, in regard to mines, the first Mines Act, 1901, contained provisions relating to safety and health but imposed no restrictions on employment of labour and hours of work. Except for this and the Factories Act, 1911, the period upto the end of the First World War (1914-18) did not see any further significant developments in the field of labour.

The period following the close of the First World War witnessed the emergence of the organizations of workers. Employers were organized even before this period, but mainly in the form of Associations and Chambers of Commerce to deal with matters of common interest pertain-

ing to trade, commerce and industry. Their aim was to protect the interests of their members. They took an active part in the discussion of legislative measures affecting trade and industrial policies, as well as those having a bearing on social and labour matters. The industrial unrest following the end of the First World War compelled employers to devote more attention to the demands of employees for improved working conditions. To some extent, this was due to the gradual growth of trade unionism (in the presently accepted sense of the term) during this period. This brought home to the employers the need for a common approach on matters affecting labour and for the first time there were some instances of employers and workers acting in consultation with each other in labour matters.

The International Labour Organization was set up in 1919 and India became a member of this organization from its inception. The membership of the I.L.O., assisted further in the spread of labour-consciousness in India. This, coupled with the economic difficulties of industrial labour following the close of war, and the prosperity of employers, led to a widespread unrest and culminated in the birth of a central organization of workers, viz., the All-India Trade Union Congress, in 1920. The political turmoil in the country provided leadership to the trade union movement. The association of political leaders with the trade union movement had mixed results.

These developments accelerated the pace of labour legislation in India. The Factories Act was amended in 1922, 1923 and 1926, to reduce the hours of work of adults to 11 a day and 60 a week, to provide payment for overtime work, to raise the minimum age of employment of children from 9 to 12 years, to extend the coverage of the Act, etc. The Mines Act, 1923, provided *inter-alia* provision for the exclusion of children under 13 years, grant of a weekly holiday and the limitation of weekly hours to 60 above ground and 54 under ground. The other important measures were the Workmen's Compensation Act, 1933, modelled on the British pattern and amended twice, once in 1926 and again in 1929, to bring it in line with the I.L.O., conventions on the subject; the Indian Trade Unions Act 1926, which is still in force; the Trade Disputes Act, 1929, etc. All these aimed at gradual improvement in the working and living conditions of labour.

The appointment of the Royal Commission on Labour in 1929, marked the next important stage in the evolution of labour and employment policies in India. The main purpose of the Commission was to enquire into the conditions of labour in industrial undertakings and plantations in British India, on the health, efficiency and standard of living of workers, on the relation between the employers and employees and to make recommendations on these matters. The Commission made comprehensive and detailed recommendations for the revision of

the old laws and/or enactment of new ones on the various aspects of working and living conditions of labour. Most of the legislation pertaining to labour enacted in the thirties arose either directly or indirectly out of the recommendations of the Commission. Under the constitution which governed India then, labour was a subject on which legislation by Provincial Governments was possible. Some of the more industrialized provinces availed themselves of this situation to enact legislation suitable to labour conditions in the respective provinces.

Then came the period of the Second World War. Labour legislation enacted during the period falls under two main headings, viz., (i) laws and regulations adopted by following the usual legislative procedure, and (ii) emergency measures, put into force by Ordinances, to meet the demands of war. Important measures that fall in the former category relate to the Industrial Statistics Act, 1942, Amendments to the Factories Act, etc. The emergency measures undertaken during the period related to the utilization of men and material to the maximum advantage for the prosecution of war by regulating (i) recruitment, (ii) discharge, (iii) transfer of technical personnel, (iv) hours of work, etc. In regard to industrial disputes, an amendment to the Defence of India Rules (Rule 81A) empowered the Central Government (i) to prohibit strikes or lock-outs in connection with any trade dispute unless reasonable notice was given, (ii) to refer disputes to conciliation or adjudication, and (iii) to require the employer not to worsen the terms and conditions of employment pending the completion of proceedings under this Rule. Another significant step taken during the period was the establishment in August 1942 of a permanent tripartite organization, subsequently called the Indian Labour Conference, at national level, composed of representatives of Governments, employers and workers. It was modelled almost on the pattern of the International Labour Organization. The tripartite Conference, though mainly an advisory body, brought together the parties concerned and even to this day continues to be the main policy recommending body in regard to labour and connected matters. The main objects of the Conference were:—

- (i) Promotion of uniformity in labour legislation.
- (ii) The formulation of a procedure for the settlement of industrial disputes.
- (iii) The discussion of all matters of all-India importance between employers, workers and Governments.

One of the earliest recommendations of the Conference accepted by the Government was the setting up of the Labour Investigation Committee whose deliberations, while bringing the work of the Royal Commission on Labour up-to-date, paved the way for the establishment of a permanent machinery for studying labour problems.

The period following the Second World War synchronized with the

complete transfer of power in India on 15 August, 1947. Immediately after the assumption of office, even prior to independence, the National Government came forward in 1946 with a five-year programme of legislative and administrative action in the field of labour. This was expected to serve as a post-war reconstruction programme for the amelioration of labour conditions and aimed at the implementation of most of the recommendations of the Labour Investigation Committee.

The programme was discussed at a special meeting of employers and workers and Central and Provincial Ministers and was generally approved. The important elements of this programme were:

#### **I. Wages**

- (a) Statutory prescription of minimum wages in "sweated" industries and occupations.
- (b) Standardization of occupational terms and wages in all the major industries and the determination of differentials in wage rates as between various occupations in an industry.
- (c) Promotion of 'fair wage' agreement including the introduction of time scales, wherever possible, with due regard to the capacity of industry to pay.

#### **II. Regulation and Improvement of Working Conditions**

- (d) Reduction in the hours of work in mines to bring the working hours in line with hours of work in factories.
- (e) Overhaul of the Factories Act with a view to the prescription and enforcement of right standards in regard to lighting, ventilation, safety, health and welfare of workers.

#### **III. Social Security Measures**

- (f) Organization of the Health Insurance Scheme, applicable to factory workers to start with, for the provision of medical treatment and monetary relief during sickness, maternity benefit on an extended scale, medical treatment in the case of disablement, etc.

#### **IV. Housing**

- (g) Provision of adequate housing for workers within the resources of both materials and man-power.

#### **V. Industrial Relations**

- (h) Trade disputes legislation to provide conciliation and adjudication machinery in respect of essential public utility services and important industrial undertakings.

- (i) Appointment of Joint Works Committees to iron out day-to-day difficulties.
- (j) Organization of industrial committees on a tripartite basis for important industries, namely, coal, cotton textiles, jute, plantations and engineering.

The programme also envisaged the strengthening of the machinery both at the Centre and States for the efficient administration of labour policies.

In spite of the declaration of the Government's intention to ameliorate the conditions of labour, industrial unrest persisted in the country in the early days of independence. The mandays lost owing to industrial disputes between 1946 and 1950 were 11.3 million per annum. Production had fallen all round. The Government of India called in December 1947 an Industries Conference consisting of representatives of Government (Centre and States), employers and workers, to consider action to be taken to remedy the situation. The Conference reached certain decisions and adopted unanimously a resolution called the Industrial Truce Resolution (1947). The Resolution recognized that increase in industrial production, which was so vital to the economy of the country, could not be achieved without the fullest co-operation between labour and management. It urged the employers to recognize the proper role of labour in industry and the need to provide fair wages and good working conditions. Labour, for its part, was required to recognize its duty towards increasing national income. The need for mutual discussion of problems common to both and settlement of all disputes without recourse to interruption in or slowing down of production was emphasized, as also the determination of a suitable method of remunerating the factors of production, keeping in view the interests of consumers, primary producers, the industry, etc. To attain these objectives the Resolution recommended *inter-alia* that —

- (i) the fullest use should be made of statutory and other machinery for the resolution of industrial disputes in a just and peaceful manner;
- (ii) a machinery be set up for the study and determination of fair wages and conditions of labour, fair remuneration for capital and methods for the association of labour in all matters concerning industrial production;
- (iii) works committees representing management and duly elected representatives of labour should be constituted in industrial units for the settlement of day-to-day disputes; and
- (v) as a first step, immediate attention should be devoted to the problem of housing of industrial labour; the cost of such housing should be shared in suitable proportions between the Government, employers and labour.

On these principles, the Resolution called upon labour and management to agree to maintain industrial peace and to avert strikes and lock-outs or slowing down of production for a period of three years.

The Industrial Truce Resolution was accepted by the Government in their settlement on Industrial Policy dated April 6, 1948. The Government considered that labour's share in profits should be on a sliding scale normally varying with production. It, therefore, appointed an Export Committee to study the question of profit sharing in industries. After detailed examination of the issues, the Profit Sharing Committee came to the conclusion that the system of profit sharing should be tried on an experimental basis in selected industries for a period of five years. Towards the end of 1948, another committee, the Fair Wages Committee, was set up to determine the principles on which fair wages were to be based and to suggest the lines on which these principles should be applied. The report of this committee even to this day provides the guidelines for the settlement of wage disputes in the organized industrial sector.

The developments referred to above led to the necessary legislative activity in the field of labour. With the passing of the Industrial Disputes Act in 1947, the Government adopted a comprehensive measure to improve industrial relations, by providing for a machinery for peaceful settlement of disputes and for setting up of Works Committees, etc. The Factories Act, 1948, aimed at plugging the loopholes in the earlier Act and also enlarging its scope in certain directions. The Minimum Wages Act 1948, sought to fix for the first time minimum rates of wages to employees in certain "sweated" industries. A pioneering measure undertaken by the Government in social insurance in the country was the passing of the Employees' State Insurance Act, 1948. It provided for certain benefits to employees in case of sickness, maternity, employment injury, etc. Other similar measures taken during the period that deserve mention are, first, the Coal Mines Labour Welfare Fund Act, 1947, creating a fund for the welfare of the coal miners and the machinery for its administration and, second, the Coal Mines Provident Fund and Bonus Schemes Act, 1948, to safeguard the future of mine workers. Legislation was enacted for compulsory recognition of trade unions and the Fair Wages Bill was also drafted.

At about this time, the constitution of independent India was being framed. It came into force on January 26, 1950. The need to improve the welfare and standard of living of the working class was recognized in the Constitution. Under Fundamental Rights, the Constitution prohibited the imposition of forced labour, and employment of children below the age of fourteen years in any factory or mine or in any other hazardous work. The Directive Principles of State Policy, apart from the provisions relating to right of work, equal pay for equal work, public assistance in case of unemployment, etc., specifically mentioned: "The

State shall endeavour to secure by suitable legislation or economic organisation or in any other way, to all workers, agricultural, industrial or otherwise, work, living wage, conditions of work ensuring a decent standard of life and full enjoyment of leisure and social and cultural opportunities . . .”

Under the Constitution, ‘labour’ is included in the Concurrent List, thus continuing the arrangements existing since 1919, and therefore, both the Union and the State Governments have powers to make laws relating to labour. However, certain items like participation in international conferences, associations and other bodies and implementation of such decisions; regulation of labour and safety in mines and oil-fields and industrial disputes concerning union employees fall exclusively within the purview of the Central Government. Items included in the Concurrent List are: trade unions, industrial and labour disputes, social insurance, employment and unemployment, welfare of labour including conditions of work, provident funds, employers’ liability of workmen’s compensation, invalidity and old age pensions, maternity benefits, vocational and technical training of labour, economic and social planning etc. However, when the provisions of an Act passed by the Union conflict with those of a State Act, the former generally prevails. Under these concurrent arrangements, some of the State Governments had enacted comprehensive legislation on industrial relations, maternity benefits, etc., even before such laws were enacted by the Central Government. Within two months of the adoption of the Constitution, the Planning Commission was set up to work out a programme of development, keeping in view the declared objective of the Government as set out in the Directive Principles of State Policy of the Constitution. In formulating the programme for labour in the First Plan, the Commission was advised by a committee called the Industries Development Committee, composed of representatives of employers and leaders of the principal workers’ organizations in the country. The Plan recognized that the worker was the principal instrument in the fulfilment of the Plan targets and said that “this co-operation will be an essential factor in creating an economic organisation in the country which will best subserve the needs of social justice”. The Plan further stated that “adequate provision has to be made for the basic needs of workers in respect of food, clothing and shelter so as to enable them to remain in a state of health and efficiency. Besides, the satisfaction of their basic needs, workers should have their due share in social and economic progress in the shape of improved health services, wider provision of social security, better educational opportunities, and increased recreation and cultural facilities.” It also emphasized the need to improve productivity for raising the standard of living of the community, and pointed out that the role of labour involved acceptance of greater regularity in attendance,

disciplined behaviour and meticulous care in the discharge of duties. Specific recommendations in regard to securing peace in industry through avoidance of dispute, overhauling of the machinery and procedure relating to settlement of disputes once they arose, defining the role and conduct of trade unions, improvement in wages, working conditions, social security, etc. were also made.

A general assessment of what happened in the First Plan revealed that the machinery for the settlement of industrial disputes worked well. There was a reduction in the number of mandays lost owing to industrial disputes. Real wages of workers were restored to the pre-war level. The desire to associate labour with management in the solution of common problems gained momentum. The importance of better working conditions came to be progressively recognized; efforts were intensified to improve housing for industrial workers. Progress was made in the implementation of social security measures like the Employees' State Insurance Act, 1948, and the Employees' Provident Fund Act 1952. Lay-off and retrenchment compensation was provided for through an amendment of the Industrial Disputes Act, 1947, in 1953.

The labour policy in the Second Plan was formulated on the basis of advice rendered to the Planning Commission by the Labour Panel composed of employers' and workers' interests and Government representatives. The Plan, while making no changes in the basic policy, emphasized the need for fuller implementation of existing laws rather than the enactment of new ones. It said: "The goal of speeding up production would mean that indiscipline, stoppage of production and indifferent quality of work will have to be guarded against". In industrial relations, emphasis was on mutual agreement. Labour legislation and the enforcement machinery set up for its implementation could only provide a suitable framework in which employers and workers could reach such agreements. The best solution to common problems, however, could be found by mutual agreement. The main elements of the policy were, avoidance of disputes, quicker disposal of disputes once they arose, adequate implementation of awards and agreements, joint consultations, greater association of workers with management through joint management councils at the level of the undertaking, observance of strict discipline both on the part of labour and management, etc. In wage policy, the evolution of a structure with rising real wages was aimed at. Appointment of wage boards consisting of employers' and workers' representatives as the machinery for settling wage demands was also recommended. Extensive and deeper coverage of the social security measures was envisaged. Apart from these a massive programme of craftsmen training was undertaken.

In accordance with the above policy, legislative activity during 1956-61 was confined to amending the existing legislation with a view to plugg-

ing loop-holes noticed in the course of implementation. Wage Boards were set up to examine the wage levels in important industries like cotton textiles, jute products, sugar, cement and plantation industries. During the Second Plan, joint management councils were set up in many units on an experimental basis. These councils have the right to obtain information regarding the working of the undertaking and also have direct administrative responsibility for matters concerning workers' welfare, training and allied matters. Their main purpose has been to provide a machinery for mutual consultation between employers and workers on matters affecting industrial relations. To enable workers to realize their role in industries and effectively participate in joint consultation, a country-wide programme of workers' education was initiated.

In industrial relations, a new approach based on moral, rather than legal, sanctions was initiated. During the early years of the Second Plan, complaints were voiced from the workers' side about the non-implementation of awards, agreements, etc., by managements, while the latter referred to the signs of indiscipline among the workers. The Plan recognized that conditions for better discipline could not be created merely by legislation but would have to be achieved jointly by organizations of employers and workers evolving suitable sanctions of their own. A code called the Code of Discipline in Industry was, therefore, adopted voluntarily by all the central organizations of employers and workers towards the middle of 1958, and has been in operation since. The Code lays down specific obligations for management and workers with a view to promoting constructive co-operation, avoiding stoppages of work as well as litigation, securing settlements of disputes and grievances by mutual negotiations, conciliation and arbitration, facilitating free growth of trade unions and eliminating all forms of coercion and violence in industrial relations. The Code carries with it its own sanctions. The working of the Code has produced encouraging results. It has created awareness amongst employers and workers of their obligations towards each other. The desire to settle disputes through mutual negotiations is growing. The Code provides for a regular grievance procedure. As a complement to the Code of Discipline, another code, called the Code of Inter-Union Conduct, has been adopted by workers' organizations in order to regulate inter-union relations. A machinery for implementation and evaluation has also been set up at the Centre and in the States to ensure observance by parties of the obligations arising from the Codes and from laws and agreements.

The Third Plan mainly envisaged an extension of the policy pursued in the first two Plans. In industrial relations, the Plan recommended that a fuller awareness of the obligations under the Code of Discipline should be extended to more units; greater recourse would have to be had to voluntary arbitration in resolving differences; and works committees

should be set up to develop harmonious relations between employers and workers at the unit level. Progressive extension of the schemes of worker participation in management and workers' education was also envisaged. To settle wage problems, the machinery of the wage board was expected to be continued. A Tripartite Bonus Commission was set up to study problems connected with bonus claims. A mid-plan appraisal of the policy pursued in the Third Plan showed that, on the whole, the policy had worked well.

Labour relations continued to be regulated by the protective legislative measures introduced in earlier Plan periods and the tripartite arrangements. A mention may be made of the Payment of Bonus Act, 1965, Shops and Commercial Establishment Act and Labour Welfare Fund Acts in States. A National Safety Council was set up in 1966. Out of the 22 wage boards set up covering almost all the major industries, 19 have submitted their reports. Under the Minimum Wages Act, 1948, minimum wages were fixed and periodically revised by State Governments in respect of various agricultural and other trades. The National Labour Commission set up in 1966 submitted its report in August 1969.

The sum up, the programmes and policies for labour envisaged under the Plans aimed at the fulfilment of certain assurances given to labour during the period immediately prior to, and following independence. Suitable alterations were made in them in the light of the socialist pattern of society adopted by Parliament in 1954 as the goal of our economic and social development. The approach is essentially pragmatic and thus flexible, as may be seen by the adoption of the Industrial Truce Resolution (1962) with the declaration of Emergency\*. While some improvement in the conditions of labour has been achieved, much remains to be done. Money wages have gone up, although improvement in real terms may not be significant owing to the rise in price level. This has occurred without disturbing the wage element in the cost of production which has gone down somewhat. The climate of industrial relation has improved: productivity has gone up. Under the plan programmes, fresh employment opportunities have been created although the achievement of the full employment level still remains a long-term objective. All this achievement is, indeed, a tribute to the realistic manner in which the policies are framed through tripartite consultation on every aspect of the framing and implementation of policy.

## II. Employment and Training

**Employment pattern and policy:** The employment policy pursued in recent years has to be viewed in the context of the pattern of employ-

\*Appendix III.

ment as it prevailed before the initiation of the planning process and the specific social and economic objectives as set forth in the Plans. The statement below compares the broad occupational distribution of the working force in India on the basis of the population censuses conducted in 1951, 1961 and 1971:

TABLE I  
Occupational Distribution of Working Force  
(Population Census Data)

| Workers engaged in                         | 1951          | 1961  | 1971  | 1951          | 1961  | 1971  |
|--------------------------------------------|---------------|-------|-------|---------------|-------|-------|
|                                            | (in millions) |       |       | (percentages) |       |       |
| Cultivation                                | 69.8          | 99.5  | 78.2  | 50.0          | 52.8  | 43.4  |
| Agricultural Labour                        | 27.5          | 31.5  | 52.0  | 19.7          | 16.7  | 26.3  |
| Mining, Manufacturing & Household Industry | 16.7          | 25.2  | 18.0  | 12.0          | 13.4  | 12.4  |
| Construction                               | 1.5           | 2.1   | 2.1   | 1.1           | 1.1   | 1.2   |
| Trade & Commerce                           | 7.3           | 7.6   | 10.0  | 5.2           | 4.0   | 5.6   |
| Transport & Communications                 | 2.1           | 3.0   | 4.4   | 1.5           | 1.6   | 2.4   |
| Services                                   | 14.6          | 19.5  | 15.7  | 10.5          | 10.4  | 8.7   |
| Total                                      | 139.5         | 188.4 | 180.4 | 100.0         | 100.0 | 100.0 |

It will be seen that nearly 70 per cent of the working population is engaged in agriculture. The excessive dependence on agriculture has affected productivity in agriculture, which is about a third of the productivity in other sectors of the economy like industry, commerce and transport. The growth of the non-agricultural sector has not been sufficient to absorb the surplus population on land, with the result that under-employment and unemployment are prevalent in the economy. It is because of this fact that employment has been one of the major objectives of planning in India.

The employment problem has two aspects: a number of people are idle and a much large number are under-employed. Low productivity and the need for improvement in living standards, associated with both whole time and partial employment, do not generate surpluses for development. Thus, both qualitative and quantitative improvement is needed in taking the economy to higher levels of development through generating employment.

It is for these reasons that employment has come to be viewed in its long-term perspective. Even here the difficulties of tackling effectively the unemployment problem may be seen from the estimates of growth in the labour force given in the Third Plan, where it is stated that during 1961-66 if our dependence on agriculture as a means of providing employment has to be reduced from 70 per cent to 60 per cent, we may still have to add over 23 millions in agriculture and allied occupations, and about double the number will have to be found for non-agricultural employment.

As to the other aspect, namely, increasing productivity simultaneously with raising the level of employment, it has been accepted that larger employment was not inconsistent with increase in the productivity of labour. Indeed, this is how the national income could be made to grow faster. Also, the other major goal of development *i.e.* reduction in inequality of income and in regional imbalances of development could be reached through a wider dispersal of employment opportunities and their suitable diversification. While, therefore, the long-term employment policy was governed by these objectives, in the short run, planning has to aim at creating employment opportunities which would help in arresting deterioration in the employment situation, *i.e.* by generating employment opportunities equivalent in number to the additions to the labour force under the Third Plan.

The magnitude of unemployment in the country was estimated to be around 5 millions in 1956 — roughly half of them in the urban areas. The Second Plan aimed at creating sufficient employment opportunities to absorb an equivalent of new entrants to the labour force estimated at about 10 millions. But the actual increase in the labour force during the Second Plan period was 1.7 million more than what was visualized, and the employment target of 10 million could not be reached, with the result that the backlog of unemployment at the beginning of the Third Plan was about 9 million. Coupled with this there was the problem of under-employment which, in terms of those who have some work and who need additional work opportunities, is estimated at 15 to 18 million.

It was in this setting and the ever growing numbers in the labour force that the Third Plan was framed. The labour force increase was estimated at 17 million and the full time employment opportunities created through Plan investments were estimated at 14 million. Partly to bridge this gap and partly to relieve under-employment, the Third Plan envisaged a large programme of rural industrialization with emphasis on rural electrification, development of rural industrial estates, promotion of village industries, etc. In addition, comprehensive rural works programmes, especially in areas where there was heavy pressure of population, was also provided for. The rural works programme aimed not merely at the creation of additional employment opportunities; it was also expected to serve as an important means of harnessing the larger manpower resources available in rural areas for economic development. It was expected that the rural works programme would provide employment on an average of about 100 days in a year, for about 2.5 million persons, by the end of the Third Plan period.

Another aspect of the employment policy was to ensure within the framework of the Plans that proper attention was being given to maximizing the employment potential of projects included in the Plan, as well as

to see that the employment effects were spread out more widely and evenly than in the past. The former involved a question of choice of techniques. In an economy with relative abundance of labour, a general bias in favour of labour intensive techniques was both natural and desirable. But specific investment decisions involving alternative techniques, had to be made in the light of a number of considerations. For instance, the establishment of basic industries like steel, machine building, heavy chemicals, oil refineries, etc., was vital to raise levels of employment in the long run. Considerations of size and technology required that these industries should be capital intensive. To make up for the low employment potential of the basic industries, it was necessary to encourage consumer goods industries through labour intensive methods. However, in road construction, housing, laying railway lines, a certain combination of men and machines had been evolved over a period of years, a combination consistent with the progressive elimination of arduous human labour. This trend had to be allowed to continue, and so was the trend towards higher productivity in established industries. Maximization of employment had to operate within these constraints.

The impact of the employment policy pursued in the last few years has been to increase the employment opportunities to a significant extent. In an economy where the predominant pattern is one of self-employment, substantial increases have taken place since the planning process started in the number of wage earners as the following Table, which gives employment increases in certain organized sectors, indicates:

TABLE II  
Average Daily Employment  
S E C T O R

| Year | Factory | Mining | Plantation | (in '1000)                                                       |
|------|---------|--------|------------|------------------------------------------------------------------|
|      |         |        |            | Central Govt.<br>including<br>Railways, P & T<br>(as on 30 June) |
| 1951 | 2,914   | 549    | 1,236      | N.A.                                                             |
| 1956 | 3,433   | 629    | 1,295      | 1,792                                                            |
| 1961 | 3,928   | 671    | 1,210      | 2,186                                                            |
| 1966 | 4,702   | 699    | 1,167      | 2,688                                                            |

Source: Indian Labour Statistics, 1960-64, 1970.\*

The 1961 Census placed the number of unemployed at 1.4 million, 0.57 in the rural areas and 0.83 in the urban areas. The 16th round of the National Sample Survey estimated that unemployment in rural areas

\*Data regarding employment in factories for the period 1951 to 1955 is only for the reporting factories/States while that for 1956 onwards includes the estimated employment regarding non-reporting factories/States.

was 1.62 per cent of the rural population and 0.82 per cent of the urban population for the period July 1960 to June 1961. On this basis, unemployment in 1961 worked out at 5.8 million in rural areas and 0.7 in urban areas. The comparative available figure for 1967-68 is 0.66 per cent of the urban population. Consequent upon widely differing estimates of unemployment, the Planning Commission set up in August 1968, a committee of experts to enquire into the estimates of unemployment worked out for the previous Plans and the data and methodology used in arriving at them.

On the basis of information available from the Directorate General of Employment and Training (which does not cover employment in agriculture and household establishments, the self-employed and the defence forces), employment increased from about 12.09 million at the end of 1960-61 to about 15.46\* million at the end of 1965-66 or about 28 per cent, the average annual growth rate being 5 per cent during the Third Plan period. The growth of employment in 1966-67 was considerably lower at about 0.8 per cent, and during 1967-68 it was almost negligible. The slow growth in non-agricultural employment since 1965-68 is attributable to the slackness in the economy, and in particular to the virtual stagnation of the industrial sector during these years. The growth of employment during 1961-68 showed marked differences in different States. It was higher than the all-India rate in Kerala, Karnataka, Tamil Nadu, West Bengal and Maharashtra; it was very low in Bihar and Orissa.

**Technical Personnel:** One of the difficulties experienced in the First and Second Plans, and which has not yet been overcome, is the shortage of technical personnel. This experience keeps the planners continuously forewarned and a sufficient emphasis is not laid on providing facilities for technical training. Special committees were appointed to assess the demand and supply of technical personnel. A machinery by which the recommendations of these committees could be implemented and the progress of implementation reviewed has also been set up. It is not necessary to go into the details of this machinery, but it would be appropriate to point out what is being done by the Government in furtherance of one important aspect of technical manpower — training at the lower levels of skills with which labour welfare is closely linked.

**Craftsmen Training:** In view of the large demand for craftsmen, training facilities available in the Labour and Employment Ministry were raised from 10,000 seats in 1956 to 43,000 seats by 1961 — the end of the Second Plan. The Third Plan envisaged a gradual expansion of such

---

\*Later revised at 16.18 million.

facilities to 1 lakh seats, with an estimated out-turn of 2 lakh craftsmen during 1961-66. A greater expansion in the craftsmen training scheme was not practicable unless sufficient facilities could be provided for the training of craft instructors. The number of Industrial Training Institutes for training craftsmen increased from 163 at the end of March 1961 to 356 in December 1968. The seating capacity increased from 42,685 at the end of 1960-61 to 146,788 in 1968-69.

**Apprenticeship Training:** During the Second Plan little progress was registered under the voluntary apprenticeship training scheme. With the enactment of the Apprentices Act, 1961, the scheme has been placed on a compulsory footing. Initially, the Act was applicable only to some engineering establishments. However, in August 1963, its coverage was extended to include almost all important industries, *e.g.*, textiles, paper, chemicals, rubber, food and beverages, construction, transport and communication, etc. The Central Government in consultation with the Central Apprenticeship Council, which was constituted in 1962, have laid down rules prescribing the minimum educational qualifications, standards of fitness, period of training, stipends to apprentices, hours of work, the number of apprentices to be trained in each establishment and industry, etc. The syllabuses for basic engineering trades have been prepared in consultation with technical experts. The State Governments have also set up State Apprenticeship Councils.

By 1969, 37,658 apprentices were undergoing training in 3,313 establishments in the public and private sectors. A Central Institute for Research and Training in Employment to conduct research in employment and periodically to impart training to employment officers was set up in 1964. The same year, the Indian Institute of Labour Studies was established in New Delhi to train Industrial Relations Officers of the Central and State Governments.

**Employment Service:** India has already a well-established employment service organization through a network of employment exchanges located at different parts of the country. Even so, each exchange covers a wide geographical area. Considerable progress has been made during the last decade in reducing the distance between exchange and job-seekers by establishing new centres. From a mere 126 exchanges in March 1951, the number of exchanges had risen to 317 by the end of the Second Plan (March 1961). There was simultaneously an enlargement of the scope of its activities. For example, under the Employment Market Information Scheme, employment information is collected on a continuous basis from all establishments in the public and private sectors employing 25 or more persons. Under the scheme of employment counselling,

guidance about careers and occupations is provided to employment seekers and occupational research and analysis is undertaken for the purpose. Establishment of University Employment Bureaux and Exchanges for the rural areas are some of the other important activities under the employment service scheme.

There were 461 Employment Exchanges including 45 University Employment Information and Guidance Bureaux, 15 Professional and Executive Employment Officers, 7 Colliery Exchanges, 8 Project Employment Exchanges, 9 Exchanges for the Physically Handicapped and 1 Special Exchange for Plantation Labour functioning in the country at the end of December 1969. In addition, 183 Employment Information and Assistance Bureaux to cater for the rural areas functioned in various Community Development Blocks. In the course of 1969, 10 additional Employment Exchanges including 2 University Employment Information and Guidance Bureaux were set up.

### III. Industrial Relations

Industrial relations in a country depend on a variety of factors, such as labour legislation, the broad economic and social policies pursued by the Government, the state of consciousness on the part of employers and workers in regard to their rights and responsibilities towards one another and towards the nation, the strength of the employers' organization, and the trade union movement, etc. As pointed out earlier, the industrial relations policy as it has evolved in the last two decades, is essentially the product of extensive tripartite consultations. At the apex of the various tripartite consultative bodies is the Indian Labour Conference set up in August 1942. Since then, all the important policy decisions in the field of labour have been taken by the Government after discussions at tripartite meetings. The policy thus represents the consensus of opinion of the parties concerned, and has acquired the strength and character of a national policy operating on a voluntary basis. Apart from the formulation of policies, the tripartite bodies look after the implementation aspects also. The main plank on which the policy rests is that the major responsibility for maintenance of industrial peace must devolve equally upon the employer's and workers' organizations, the Government intervening only if disputes are not mutually settled.

The earliest known act relating to the settlement of trade disputes was the Employer's and Workmen (Disputes) Act, 1860, which provided for summary disposal by magistrates of disputes relating to wages of certain kinds of workers. Apart from its limited character, it contained various undesirable provisions like a breach of contract on the part of a worker being a criminal offence. It fell into disuse and was finally

repealed. The next significant legislative step taken towards regulation of industrial relations was the Trade Disputes Act, 1929. In between, different measures were adopted to prevent the occurrence of disputes as well as their settlement. The constitution of Works Committees received attention at an early stage. Works Committees were for the first time set up in 1920 in Government presses. Similar committees were also set up by the Tatas at Jamshedpur, the Buckingham and Carnatic Mills at Madras, etc., and by many progressive employers, but the results achieved were by and large disappointing. In addition to Works Committees, there were also occasions when conciliation or arbitration was undertaken by individuals or specially appointed committees or courts. The first attempt to settle disputes through formal bodies like courts was made in Madras in 1919-20. These were followed by other committees in other provinces also. One such committee known as the Fawcett Committee was set up in 1928 by the Government of Bombay for the settlement of the dispute between the employers and workers in cotton mills. So far as conciliation and arbitration was concerned, the individuals (usually officials) were also generally successful in bringing about settlements. Apart from these official efforts at settling labour disputes, Ahmadabad saw a standing arrangement for arbitration between labour and management, an arrangement which envisaged that if the arbitrators on behalf of workers and employers did not agree, the matter would be referred to a mutually agreed umpire.

**Trade Disputes Act, 1929:** The widespread industrial unrest following the close of the First World War brought into focus the need for legislation for the settlement of industrial disputes. Committees were set up in 1921 by the Provincial Governments of Bombay and Bengal to examine the feasibility of introducing legislation. Though Bombay had a bill ready in 1924, it was not processed through the legislature. The Trade Disputes Act was passed in 1929 by the Central Legislature. It provided for the setting up of Courts of Enquiry and Boards of Conciliation for the settlement of disputes. The Act also contained provisions rendering punishable by fine or imprisonment, lightning strikes or lock-outs in certain public utility services and embodied a provision aimed at the prevention of general strikes. The Act was originally limited in its operation to 5 years but was made permanent by an Act in April 1934.

**State Legislation:** The Royal Commission on labour which was appointed soon after the Trade Disputes Act 1929, was passed, recommended the establishment of permanent courts instead of *ad hoc* tribunals. They also emphasized the need to make available to the parties the services of Conciliation Officers and others in the earlier stages of the dispute, so as to bring the parties privately to agreement. To imple-

ment these recommendations, the Government of India amended the Act in 1938. In the meantime, Bombay had passed the Bombay Trade Disputes Conciliation Act, 1934, which, while not directly based on the Royal Commission's recommendations, incorporated some of its suggestions. It provided for the appointment of Chief Conciliators/Special Conciliators and Assistant Conciliators. The conciliators were empowered to initiate conciliation proceedings in cases where a trade dispute existed or was apprehended, to enforce the attendance of parties, obtain evidence etc. The Act was, however, made applicable only to the textile industry in Bombay City and the Bombay Sub-urban District. The Bombay Industrial Disputes Act, 1938, a later creation, provided for elaborate machinery for the settlement of disputes by conciliation or by arbitration. The Act provided *inter alia* for, first, appointment of a Board of Conciliation in case a dispute could not be settled by a conciliator; second, appointment of an Arbitrator or a Court of Industrial Arbitration; thirdly, declaration of strikes and lock-outs as illegal during negotiations and conciliation proceedings; fourthly, registration of unions recognized by employers; and finally, penalties for victimization of workers under certain circumstances. The Act was amended once in 1941 to make arbitration compulsory in certain cases.

The Trade Disputes Act, 1929, was amended in 1938 to provide for the appointment of conciliators as recommended by the Royal Commission. It also extended the definition of trade disputes to cover differences between employers and employees, or between workmen and workmen, and included transport and tramways under public utility services. Provisions concerning illegal strikes and lock-outs were also made less restrictive. Even so, for various reasons, the Act was not sufficiently used for settling labour disputes.

The Second World War called for more definite measures to deal with disputes than were provided under the then existing Acts or under the contemplated amendments. In January 1942, the Government of India introduced a new rule, Rule No. 81-A, to the Defence of India Rules, with a view to dealing with trade disputes. The details of this new rule have been quoted earlier in this chapter under the section on 'Policy Before and After Independence'. The principle of compulsory adjudication in the settlement of labour disputes was, as will be clear, introduced in the early forties and has remained with us ever since.

**Industrial Disputes Act, 1947:** Rule 81-A of the Defence of India Rules was in operation upto September 30, 1946; it was extended by an ordinance in 1946 for a further period of six months pending enactment of a suitable legislation. The Government had found the rule useful in preventing industrial unrest and felt the need to incorporate its compul-

sions in the permanent labour law of the country. The Government, therefore, enacted the Industrial Disputes Act in March 1947, incorporating in it many of the important provisions of the Trade Disputes Act, 1929, and the Rule 81-A of the Defence of India Rules. The Act provided for two new institutions viz. the 'Works Committees' and the 'Industrial Tribunals' for the prevention and settlement of disputes. The Act empowered the appropriate Government to order establishments employing more than 100 workers to set up Works Committees. Disputes could be referred to the Court of Enquiry, Board of Conciliation or Industrial Tribunal. It also sought to reorient the administration of conciliation machinery by making conciliation obligatory in all disputes in public utility services, and optional in other cases. With a view to expediting conciliation, time limits were prescribed for their completion. The Act prohibited strikes or lock-outs during pendency of conciliation or adjudication proceedings.

The following details show the functioning of the Central Industrial Relations Machinery:

TABLE III

|                                                                          | 1969         | 1970         | 1971         |
|--------------------------------------------------------------------------|--------------|--------------|--------------|
| 1. Number of disputes referred to Central Industrial Relations Machinery | 6,731        | 6,953        | 6,705        |
| 2. Number of failure reports received:—                                  |              |              |              |
| (i) of (2) above. No. of disputes referred to adjudication               | 323<br>(37+) | 297<br>(31+) | 368<br>(38+) |
| (ii) of (2) above. No. of disputes referred to arbitration               | 70<br>(80+)  | 55<br>(60+)  | 13<br>(10+)  |

Apart from the Central legislation, some of the State Governments, namely, Bombay, Madhya Pradesh and Uttar Pradesh had also taken statutory measures for prevention and settlement of industrial disputes. These, while containing most of the basic features of the Central Act, sought to supplement them in certain respects.

**The First Plan:** The Central Act was amended from time to time to take care of deficiencies in its working as also to suit requirements of planned development. The First Plan, for instance, recommended the framing of suitable statutory provisions on the following principles:

- (i) legal technicalities and formalities of procedure should be reduced to the minimum;
- (ii) the machinery and procedure should be adopted to varying needs;
- (iii) selection, recruitment and training of personnel of courts should be carried out to secure competent disposal of cases;
- (iv) there should be no appeal from decisions of an industrial court or tribunal save in exceptional cases; and

- (v) provision of law should be adequate to secure prompt compliance with the term of any award of decision.

The amended Act, therefore, provides for a three-tier system of original tribunals, consisting of Labour Courts, Industrial Tribunals and National Tribunals. The function of the Labour Courts is mainly to adjudicate upon certain minor matters. The jurisdiction of the Industrial Tribunals is wider and extends to more important matters like wages and allowances, hours of work, leave and holidays and bonus. The National Tribunals may be appointed by Central Government to decide disputes which involve questions of national importance and those which affect establishments situated in more than one State. In this process, the Labour Appellate Tribunals, which was brought into existence by an amendment of the Industrial Disputes Act in 1950 to bring about uniformity in Industrial Tribunal decision, was abolished. By an amendment made in 1952, the appropriate Government has been empowered to include within the scope of general adjudication even units in which no disputes might actually exist. A provision has also been made in the Industrial Disputes Act for voluntary reference of disputes to arbitration by the parties themselves by written agreement and for the enforcement of voluntary agreements reached between the parties. A special feature of the Act is the provision made for lay-off and retrenchment compensation by an amendment carried out in 1953. This again was to answer the specific need of the hour when lay-off and retrenchment had affected the climate of industrial relations and some effective action was considered necessary against them.

**The Second Plan:** Apart from the reorganization of the industrial disputes settlement machinery to which a reference has been made earlier, the First Plan also made specific recommendations regarding the need for avoidance of industrial disputes, promotion of internal settlements, mutual consultation through various committees, collective bargaining, conciliation, etc. Much of what was recommended in the First Plan also held good in the Second Plan. The Second Plan recommended, in particular, the following:

- (i) "Greater emphasis should be placed on avoidance of disputes at all levels, including the last stage of mutual negotiations, namely conciliation.
- (ii) "Once dispute arose, recourse should be had to mutual negotiations and voluntary arbitration in the machinery for facilitating these stages should be built up by Central and State Governments. However, in intractable cases, where these methods fail recourse to Government intervention would be unavoidable.
- (iii) "While the responsibility for implementation should be mainly on the employer (public or private) an appropriate tribunal

should be constituted for enforcing compliance.

- (iv) "While observance of stricter discipline both on the part of labour and management is a matter which cannot be imposed by legislation — it has to be achieved by organisations of employers and workers by evolving suitable sanctions of their own, some steps legislative or otherwise in case of rank indiscipline to be thought off".

The emphasis was thus on prevention of disputes. But once a dispute arose, it was to be settled by mutual negotiations and recourse to adjudication was thought of only as a last resort. In addition, the Plan recommended the greater association of workers with management and their education to make them better citizens.

**Code of Discipline in Industry:** Most of the important recommendations made in the Second Plan were given effect to by the decisions taken at the 15th session of the Indian Labour Conference held in July 1957. This marked another important stage in the evolution of labour relations policy in India in a number of vital and far-reaching decisions were taken at that session. The session unanimously adopted a code called the 'Code of Discipline in Industry'. The code aims not only at the prevention of industrial disputes, but also at the creation of a suitable atmosphere for constructive co-operation between employers and workers. The significance of the code lies in its voluntary acceptance of mutual obligations. It places greater reliance on moral sanction than on legislation. The provisions of the code cover the entire field of industrial relations like the prevention and settlement of disputes, discipline at the place of work, avoidance of work stoppages, implementation of the awards, agreements, settlement and decisions, avoidance of litigation, etc. The code required the framing of a model grievance procedure to minimize delays in the settlement of grievances.\* A Central tripartite evaluation and implementation machinery has been set up to implement the code. Similar machinery exists at the State levels also.

On the voluntary side, the 'Code' of Discipline in Industry (1958) and the Industrial Truce Resolution (1962) continued to have their impact on industrial relations in the country. This is reflected in the data given in Table IV.

**Worker Participation in Management and Workers' Education:** As the objective of social and economic policy, the Second Plan referred to the need for creation of industrial democracy as a pre-requisite for the establishment of a socialistic society. As a first step in this direction, it recommended the increased association of labour with management.

\*See Appendix I

It further observed that such a measure would help in "(a) promoting increased productivity for the general benefit of the enterprise, the employees and the community, (b) giving employees a better understanding of their role in the working of the industry, and (c) satisfying the workers' urge for self-expression, thus leading to industrial peace, better relations and increased co-operation." For this purpose, it suggested the setting up of Joint Management Councils consisting of representatives of employers and workers. Such councils are already operating in 80 units.

TABLE IV

|                                                           | 1969 | 1970 | 1971 |
|-----------------------------------------------------------|------|------|------|
| 1. Number of complaints received                          | 609  | 696  | 306  |
| 2. Number of complaints not requiring action              | 240  | 186  | 47   |
| 3. Number of complaints requiring action                  | 369  | 510  | 259  |
| 4. Of these requiring action (percentage of complaints)   |      |      |      |
| (a) Not substantiated on enquiry                          | 6    | 3    | 2    |
| (b) When the breaches were set right or settled otherwise | 34   | 9    | 13   |
| (c) Under investigation                                   | 60   | 88   | 85   |

The scheme of Joint Management Councils is designed to ensure closer and fuller association of workers in management on a voluntary but formally-defined basis. Such councils were functioning in 80 establishments, 31 in the public and 49 in the private sectors. The break-up of the units where Joint Management Councils were functioning during 1971-72 is as follows:

TABLE V

|                       | Public Sector | Private Sector | Total |
|-----------------------|---------------|----------------|-------|
| 1. Manufacturing      | 9             | 33             | 42    |
| 2. Mining             | 13            | 13             | 26    |
| 3. Plantations        | ..            | 2              | 2     |
| 4. Service Industries | 9             | 1              | 10    |
| Total:                | 31            | 49             | 80    |

The aim of the concurrent scheme of workers' education was to educate the workers in their rights and responsibilities *vis-a-vis* production and for the better performance of their duties as citizens. It was also designed to enable them to participate intelligently in the scheme of worker participation in management. The scheme comprises the training of teacher-administrators and worker-teachers. The latter, on returning to their establishments on the completion of the training, start unit level classes for the rank and file. Substantial progress has been achieved under this scheme.

**The Third Plan:** The Third Plan did not suggest any major change in policy. It emphasized the economic and social aspects of industrial peace and elaborated the concept that workers and managements were partners in a joint endeavour to achieve common ends. The voluntary arrangements agreed to in the Second Plan were strengthened by the Industrial Truce Resolution, 1962, adopted in the wake of the Chinese Aggression. The Industrial Disputes Act was amended in 1965 with a view to giving an individual worker the right to raise a dispute connected with his discharge, dismissal, retrenchment or termination of service even if the cause of the individual workman was not espoused by any union or group of workmen.

**Workers' Organizations:** The evolution of the labour relations' policy of a country is conditioned by the existence of strong organizations of employers and workers. A strong trade union movement is necessary to safeguard the interests of labour and to achieve increased production and productivity. Workers in India have been exercising their right of association since the turn of the century but real encouragement to the movement came through the Indian Trade Unions Act, 1926. With some minor modifications, the Act still holds the field. While a number of trade unions were formed between 1926 and 1947, the real organizational effort on behalf of labour was seen only since independence. The number of registered trade unions increased from 2,800 in 1947-48 to 11,677 in 1961-62. The membership of the unions which furnished returns also increased in the same period from 1.7 to 4.0 million in 1960-61. While the number of trade unions and their membership has gone up during the 15 years, the number of members per trade union has declined.

The number of unions claimed and verified by the Indian National Trade Union Congress in 1966 was 2,046 and 1,305 respectively; that for the Hind Mazdoor Sabha was 498 and 258 respectively; and for the United Trade Union Congress 364 and 170 respectively. For details of the membership of the 4 Trade Unions and their membership for the period 1951-67, the following Table may be seen:

TABLE VI  
Membership of Trade Union Organization  
(1951-1967)

| Year | Indian National Trade Union Congress |             | All India Trade Union Congress |             | Hind Mazdoor Sabha |             | United Trade Union Congress |             |
|------|--------------------------------------|-------------|--------------------------------|-------------|--------------------|-------------|-----------------------------|-------------|
|      | Affiliated Unions                    | Member-ship | Affiliated Unions              | Member-ship | Affiliated Unions  | Member-ship | Affiliated Unions           | Member-ship |
| 1951 | 1,232                                | 1,548,568   | 736                            | 758,314     | 517                | 804,337     | 332                         | 384,962     |
| 1956 | 604                                  | 930,968     | 481                            | 306,963     | 157                | 211,315     | 228                         | 195,242     |
| 1961 | 860                                  | 1,053,386   | 886                            | 508,962     | 190                | 286,202     | 229                         | 110,034     |
| 1967 | 1,305                                | 1,417,553   | 808                            | 433,564     | 258                | 436,977     | 170                         | 93,454      |

A feature of the trade union movement in India is its dependence, to some extent, on outsiders for leadership. This has had both beneficial and harmful effects. But for the outside leadership, the movement would not have reached even its present dimensions and strength. At the same time, the association of outsiders has generated unhealthy rivalries. However, of late, a trend towards decrease in the number of outsiders managing trade unions is clearly discernible. It is hoped that Workers' Education Programme will accelerate this progress. The movement is at present affiliated to the four following main organizations of workers: (i) The Indian National Trade Union Congress which has the largest verified membership; (ii) The All-India Trade Union Congress, (iii) The Hind Mazdoor Sabha, and (iv) The United Trade Union Congress. To remedy the evils of a divided Trade Union Movement, a code, called the 'Inter-Union Code of Conduct' was voluntarily accepted in 1958 by all the Trade Union organizations as a complement to the Code of Discipline in Industry. The Code of Conduct aims at the promotion of harmonious inter-union relation and healthy growth of trade union movement.\*

**Employers' Organizations:** The employers are organized industry-wise and also region-wise. There are, for instance, employers' organizations for textiles, tea, coffee, mining, engineering and so on, in centres where their special interest requires protection. Chambers of Commerce or business associations functioning in important cities and trade centres bring together varied interests among the employers' organizations. Those associations, however, form an integral part of the national organizations, such as the All-India Organization of Industrial Employers, the Employers Federation of India and All-India Manufacturers Organization. These organizations, as also the workers' organizations referred to earlier, are recognized by the Government and participate in the discussions at the national level. In addition to these, there are also professional bodies like the Indian Institute of Personnel Management in Calcutta, the National Institute of Labour Management in Bombay which spread ideas concerning the importance of human values in industry and promote healthy labour-management relations.

#### IV. Wages and Social Security

In countries where the employers' and workers' organizations are well matched, wage agreements are arrived at on the basis of collective bargaining. While this approach is prevalent in India where unions are strong, the dominant pattern for wage settlement is through State intervention which during World War II, secured for workers some

\*See Appendix II

*wage increases. Even so in real terms, the situation had deteriorated as compared to the pre-war because of the rise in prices. In the absence of guiding principles, the wage awards of those days were based on the individual judgement of adjudicators and the conditions prevalent in individual units. In consequence, a number of anomalies crept in the wage structure. The task in the post-war period, therefore, was to secure the 1959 level of real earnings and simultaneously proceed in the direction of evolving a scientific wage pattern.*

**Wage Policy:** Since 1948, wage standardization has been secured in almost all important organized industries mainly through the efforts of Industrial Tribunals, — except in recent years when wage boards have become more common. A vital component in addition to the basic wage since World War II has been the dearness or cost of living allowance. The system of paying a bonus to workers, which also started during the World War II in certain industries, has now become an accepted annual addition to the pay packet.

**The First Plan:** Subject to reasonable restraints on wages and profits, the main aim of wage policy was to “restore the pre-war real wages, as a first step towards the living wage, through increased productivity resulting from rationalization and renewal or modernization of plant.” Wage increase to remove anomalies or where the existing rates were abnormally low was also not ruled out. In settling wage claims, it was recommended in particular that:—

- (i) wage adjustments should conform to the broad principles of social policy and disparities of income have to be reduced to the utmost extent;
- (ii) the claims of labour should be dealt with liberally in proportion to the distance which the wages of differed categories of workers have to cover to attain the living wage standard; and
- (iii) the process of standardization of wages should be accelerated and extended to as large a field as possible.

The working of the wage policy in the First Plan resulted in substantial gains to the industrial workers. For the first time, the wages of workers reached the pre-war level in 1953 and even went beyond significantly by 1955. The improvement in real wages was due partly to the increase in money earnings which went up by about 20 per cent over the period and partly to the fall in the price level.

**The Second Plan:** It was framed in the atmosphere of increasing unemployment and which emphasized the need for developing basic industries, recommended a cautious wage policy directed towards avoiding inflationary pressures. It admitted that much remained to be done

especially in matters like covering the distance between the existing wage and 'fair wage', but progress in this regard would only be gradual. It said the evolution of a wage policy which aimed at a structure with rising real wages required to be evolved. The drag exercised by the marginal units in drawing a suitable wage structure based on the principle of fair wage, was recognized and steps to make these units more viable were recommended. Several recommendations to improve productivity, like introduction of incentive payments, payment by results, rationalization etc., were also made. The Plan further stated that "a more acceptable machinery for settling wage disputes will be one which gives the parties themselves a more responsible role in reaching decision. An authority like a Tripartite Wage Board, consisting of equal representatives of employers and workers and an independent Chairman will probably ensure more acceptable decision. Such Wage Boards should be instituted for individual industries in different areas."

In pursuance of the recommendation made in the Plan, a number of Wage Boards were set up during the Second Plan. These covered major industries like cotton textiles, cement, sugar, jute and tea plantations. The final recommendation of the first three were received before the expiry of the Second Plan period and their implementation started from 1960. Almost all the units in those industries have by now implemented these recommendations. The other Wage Boards and those constituted since have completed their work. The impact of the policy pursued in the Second Plan resulted in an increase in money wages by about 19 per cent during the period. However, in real terms, the workers suffered as compared to the First Plan due to increase in the price level.

**The Third Plan:** The policy in regard to wages in the Third Plan was more or less an extension of the policies pursued in the two previous Plans. Recognizing the need for rapid economic progress, the Plan suggested that the fruits of economic progress should be shared equitably and that economic and social organizations should be oriented towards achieving the objectives of a socialist society. In particular, it was stated that the surpluses generated in industry were a social product to which neither employers nor workers could lay an exclusive claim, their distribution must be according to the worth of the contribution of each, subject to the needs of development and the well-being of all sections of the community, especially the satisfaction of the basic needs of all. The need for improving productivity both in the context of larger economic programme and the improvement of the standard of living of the working class was highlighted in these words: "Neither the exercise of their organized strength in industrial conflicts nor laws and the intervention of State can help the workers much in realizing their aspirations. Their gain can arise only out of the strength and dynamism of the econo-

my, the only enduring basis of which is a rising level of productivity. No increase in profits which does not come out of improvements in productivity but has its origin in current scarcity and the stresses of development, can be regarded as a sign of prosperity. For the workers no real advance in their standard of living is possible without a steady increase in productivity, because any increase in wages generally, beyond certain narrow limits, would otherwise be nullified by rise in prices."

The First Plan recommended that wage increase should be granted mainly to remove anomalies or where the existing rates were very low. It also recommended restoration of the pre-war levels of real wages as a first step towards a 'living wage'. These features were reasserted in the Second Plan, but a shift in emphasis was introduced: it required that improvement in wages should result mainly from increased productivity. Two developments during this period are worthy of note: (i) the recommendation of the 15th Indian Labour Conference in regard to the need-based minimum wage, and (ii) the Report of the Second Pay Commission in respect of Central Government employees, whose recommendations about the need-based minimum wage created public controversy. The Third Plan generally endorsed the recommendations of the earlier Plans in regard to the minimum wage with the proviso quoted above.

By 1970, all the Wage Boards which had been set up in the previous years had submitted their reports, and Government decisions on these reports have been announced. This completed the process of wage fixation in all the major industries for which Wage Boards were set up since the inception of the system in 1957.

**Bonus Commission:** Apart from the setting up of new Wage Boards already referred to a significant step taken during the Third Plan was the setting up of the Tripartite Bonus Commission to study the problems connected with bonus claim and to evolve guiding principles for bonus payment. The commission which submitted its report in 1964 has recommended in particular:—

- (i) That the surplus available for payment of bonus should be determined after providing for depreciation, income tax, super tax and returns on paid up capital at 7 per cent and on reserves at 4 per cent.
- (ii) That an employee should be entitled to a minimum of 4 per cent of his annual earnings made up of basic wages and dearness allowance as bonus or Rs. 40.00 whichever was higher.
- (iii) That 60 per cent of the available surplus should be earmarked for the payment of bonus.
- (iv) That the maximum limit for the payment of bonus should be 20 per cent of the earnings by way of basic wage and dearness

allowance.

The commission has also made detailed recommendations in regard to the employees to whom their recommendations should apply, the maximum bonus payable to certain categories of employees, the manner of providing for set off and set on, etc.

The Payment of Bonus Act, 1965, was enacted very recently. It must be given a longer period of trial. Some workers' organizations have objected to the coverage and quantum of the available surplus. Bonus payment already covers a large number of workers coming under the Industrial Disputes Act of 1947 who formerly did not have this benefit. Also, the available surplus for bonus payment has already been enlarged by the recent amendment to the Payment of Bonus Act, 1965. Calculations made at the official level indicate that the additional amount disbursed in bonus as a result of the implementation of the Payment of Bonus Act is about Rs. 16 crores and the 'ax loss about Rs. 8 crores annually.

One of the significant achievements during 1971 was an agreement brought about between the workers and employers on the question of bonus for the year 1970. The agreement *inter-alia* provided for the payment, in addition to the statutory minimum bonus, a graded advance ranging from 1 to 4½ per cent based on the gross profits earned. The advance was to be adjusted against future payments of bonus payable subject to decisions on the recommendations of the 'Committee on Bonus' to be set up for the purpose. The setting up of a Tripartite Committee to go into the whole question of bonus was endorsed at the 27th Session of the Indian Labour Conference held in October 1971. The composition and terms of reference of the committee are expected to be announced soon.

It will now be useful to study the changes in money and real earnings in recent years for certain categories of workers. The Table VII gives the indices of money and real earnings of industrial workers since 1947. Although a strict year-to-year comparison is vitiated to some extent by changes in scope, coverage etc., these figures give a fairly accurate picture of the gains accruing to labour since independence. The indices relate to average annual earnings of employees earning less than Rs. 200 per month in factories covered under the Payment of Wages Act, 1936.

The money earnings of workers in the manufacturing sectors have gone up by 71 per cent in 1970 as compared to 1961. The real earnings rose only by 1 per cent during the same period. The latest available data for 1970 shows that in 1970, the real as well as money earnings of those workers had increased by 6.9 per cent and 7.4 per cent respectively as compared to the level in the previous year.

**Coal Miners:** A long history of wage disputes in coal mining came to

an end with the enforcement of the award of the All-India Industrial Tribunals (Collieries). The Coal Tribunals' award which came into effect from about the middle of 1956, recommended increase in the wages of different categories of workers. Since then, employers and workers have shown considerable wareness of their responsibilities and the industry has been working with an improved level of efficiency. A Tripartite Wage Board was set up in 1963 to analyse the wage structure etc., in coal mining. An interim increase in wages was recommended by the Wage Board. An indication of the gain made by the coal mine workers since independence can be had from the Table VIII which gives the indices of money earnings of workers employed in mines.

**TABLE VII**  
Indices of Money Earnings and Real Earnings of Employees Earnings Rs. 200  
Per Month in Factories Covered by the Payment of Wages Act, 1956 (1947=100)

| <i>Year</i> | <i>Money earnings</i> | <i>All-India average<br/>consumer price index</i> | <i>Real earnings</i> |
|-------------|-----------------------|---------------------------------------------------|----------------------|
| 1948        | 120.0                 | 111.7                                             | 107.4                |
| 1949        | 134.4                 | 115.0                                             | 116.9                |
| 1950        | 132.0                 | 115.8                                             | 114.0                |
| 1951        | 140.9                 | 120.8                                             | 116.6                |
| 1952        | 150.9                 | 118.3                                             | 127.6                |
| 1953        | 151.0                 | 121.7                                             | 124.7                |
| 1954        | 151.8                 | 115.8                                             | 131.1                |
| 1956        | 159.4                 | 110.0                                             | 144.9                |
| 1956        | 162.6                 | 120.8                                             | 134.6                |
| 1957        | 170.2                 | 127.5                                             | 133.5                |
| 1958        | 172.3                 | 133.3                                             | 129.3                |
| 1959        | 178.1                 | 139.2                                             | 127.9                |
| 1960        | 189.4                 | 142.5                                             | 132.9                |
| 1961        | 193.7                 | 145.0                                             | 138.9                |
| 1962        | 204.3                 | 149.6                                             | 135.6                |
| 1963        | 206.0                 | 154.1                                             | 132.7                |
| 1964        | 214.7                 | 144.8                                             | 148.3                |

**TABLE VIII**  
Indices of Money Earnings of Workers Employed in Mines during  
December Each Year on Base: 1947=100

|      |       |      |       |
|------|-------|------|-------|
| 1947 | 100.0 | 1955 | 132.4 |
| 1948 | 105.5 | 1956 | 173.0 |
| 1949 | 109.7 | 1957 | 192.6 |
| 1950 | 114.3 | 1958 | 105.6 |
| 1951 | 120.5 | 1959 | 220.6 |
| 1952 | 127.4 | 1960 | 228.5 |
| 1953 | 127.2 | 1961 | 238.6 |
| 1954 | 129.9 | 1962 | 246.9 |

In the mining sector also, the money earnings and real earnings of workers had increased by 96 per cent and 16 per cent respectively in 1969 as compared to 1961.

**Central Government Employees:** The pay and service conditions of Central Government employees come up for review by the First Pay Commission in 1946-47. Prior to this, for about 30 years the basic

structure of salaries of Government servants continued to conform to the pattern recommended by the Royal Commission on the Public Services in India (1912-15). The Royal Commission on the Superior Civil Service in India (1923-24) expressed full agreement with the principles adopted by the earlier commission. With the passage of time, a necessity arose to review the pay and service conditions of Central Government employees and accordingly a Second Pay Commission was set up in 1957 to:—

- (i) "Examine the principles which should govern the structure of emoluments and conditions of service of Central Government employees" and
- (ii) "Consider and recommend what changes in the structure of emoluments and conditions of service of different classes of Central Government employees are desirable and feasible."

In making their recommendations, the Commission was to take into account the historical background, the economic conditions in the country and the implications and requirements of developmental planning, and also the disparities in the standard of remuneration and conditions of service of the Central Government employees, on the one hand, and of the employees of State Governments, local bodies and aided institutions, on the other, and all other relevant factors.

The Commission made detailed recommendations in 1959 in regard to the various matters referred to it and those come into effect on July 1, 1959. The present wage structure and service conditions of Central Government employees are the outcome of those recommendations. Some State Governments have also followed the Central Government and had the wage structure etc. of their employees examined by competent bodies.

The Government announced on April 30, 1970, a 5-member Third Pay Commission for Central Government employees. This Commission was asked to enquire into and make recommendations regarding—

- (i) the principles which should govern the structure of emoluments and conditions of services of Central Government employees;
- (ii) what changes in the structure of emoluments and conditions of service of different classes of Central Government employees were desirable and feasible;
- (iii) death-cum-retirement benefits of Central Government employees;
- (iv), (v) & (vi) the same for all-India services; personnel belonging to armed forces; and employees of Union Territories;
- (vii) while inquiring into the level of minimum remuneration, the Commission may examine the Central Government employees' demand for a need-based minimum wage, having regard to all relevant factors.

In case the need for consideration of relief of interim character arises during the course of the deliberations of the commission, the

commission could consider the demand for relief of an interim character and send reports.

Under this provision, the Commission did recommend two Interim Reliefs till the end of 1972, and the Government accepted the recommendations.

**Banks:** The award of the First Pay Commission had its impact on the pay and service conditions of bank employees who were placed more or less in a similar position as the Central Government servants. In particular, in the year following independence, the white collar group in different industrial and commercial employments started building up its own organizations and a number of wage disputes in banks, insurance companies and important commercial houses were settled directly or through the machinery of conciliation and adjudication provided by the Government but by themselves these did not help in a uniform determination of wage levels in the banking industry. Starting with the Sen Tribunal in 1949, the demands of the bank employees were examined by several agencies like the Sastry Tribunal in 1952, the Labour Appellate Tribunal in 1954 and the Bank Award Commission in 1955. The recommendations of the Commission were embodied by the Government in the Industrial Disputes (Banking Companies Decision) Act, 1955, which remained in force till March 31, 1959. The Government, thereafter, constituted the National Industrial Tribunal (Bank Disputes) in 1960 to adjudicate on the dispute between the banks and their employees. The Tribunal by its award in June 1962 divided the banks into three categories and the country into three areas and recommended pay scales for various categories of staff separately for each class of bank and the area in which it was located. To compensate for a rise in prices, it recommended a system of dearness allowance linked with cost of living index with a 100 per cent neutralization for subordinate employees and smaller for others. Recommendations were also made about provident fund, gratuity, pension, retirement age and special allowance for some categories of workmen. The award was accepted in full by the Government.

**Working Journalists:** The lack of a standardized wage structure and the consequent discontent for working journalists led to the appointment of Wage Board for them in 1957. The recommendations of the board were set aside by the Supreme Court on the ground that they did not take into account the paying capacity of the industry. As a result, a committee was set up in 1958 to examine the wage scales. The committee's report was implemented in 1959 with some modifications. A Wage Board was appointed in 1963 to examine afresh the structure of wages in this industry.

**Agricultural Workers:** The difficulties in securing minimum wages in agricultural occupations is well recognized. It has, therefore, been considered that a selective approach might help in achieving enforcement of wage standards. To permit such selection, the Minimum Wages Act was amended to enable the State Governments to fix wages for certain categories of agricultural workers and in selected areas of each State, where the wage level was considered to be abnormally low. Several State Governments had already fixed minimum wages in agriculture on this pattern. The wage rates for persons employed in agricultural occupations vary from place to place. To obtain useful information regarding the wages, employment, etc. of agriculture workers, two enquiries were conducted, the first in 1950-51 and the other in 1956-57. A close scrutiny of the data thrown up by those enquiries revealed that there was no marked deterioration or improvement in the economic conditions of agricultural labour households in 1956-57 as compared to 1950-51. It would thus appear that the Plan objective of improving the conditions of the lowest stratum of the community has not been achieved during the period covered by the two enquiries.

Among the unorganized groups, agricultural labour is the most important. The benefits of general economic development have not reached this group of workers to any appreciable extent. The draft Fourth Plan provides for various programmes for improving the lot of agricultural workers. The Department of Labour and Employment have proposed action programmes for promoting welfare of agricultural workers through Model Welfare Centres, Mobile Health Units, Shopcum-Cinema Vans, etc., and for setting up an advisory service on the lines of the Factory Advice Service, to undertake work study in the field of agriculture to afford facilities of training and assistance to agricultural labour to attend to the problems of safety, hygiene, etc. A beginning will be made with work on these lines consistent with the funds that could be made available for this purpose.

**Wage Census:** On the recommendation of the Second Plan, an occupational wage survey was conducted during 1958-59. The survey throws light on the numerical aspect of employment according to the representative occupational groups and their employment status, wages and earnings, concentration and dispersion according to sex groups, time and piece work, job description, wage differentials, etc. It is expected that the information thus collected would be of immense use to the wage fixing authorities and may provide the basic material for defining and establishing suitable relationships between workers, jobs and groups of jobs. The census covered 37 factory industries, three plantations and four mining industries. These together represent approximately 76 per cent of employment in factories, nearly the whole of plantations

and 85 per cent in mining. The General Survey Report has been published along with reports covering all the 44 industries.

The second Occupational Wage Survey was conducted during September 1964 and February 1965 and the data collected by it were scrutinized, coded and preliminary tabulations completed. In August 1968, it was decided that tabulation of the data in respect of the Survey should be done by the Machine Tabulation Unit of the Bureau. Accordingly, preparation of the detailed instructions for estimation procedure to be adopted for different items of information was started and the major portion of this work had been completed by 1970.

**Social Security:** The successful working of the social security schemes in other countries provided the necessary impetus and guidance for the introduction of social security schemes in India. The earlier measures for ensuring social security to workers include legislation providing for workmen's compensation for all workers and maternity benefits for women workers. The employer was held responsible for the payment of compensation to workers, according to a fixed schedule in cases of incapacity, permanent disability and death. The payment of maternity benefits to women workers is governed by State enactments. In order to bring about uniformity in maternity benefits available under different enactments, the Central Government passed the Maternity Benefit Act, 1961. The Act is applicable, in the first instance, to mines, plantations and factories covered by the Employees' State Insurance Act. It incorporates the important progressive measures included in all the then existing acts on this subject.

**Employees' State Insurance:** The passing of the Employees' State Insurance Act, 1948, was another significant step taken towards provision of social security measures. The Act enabled the factory worker to obtain sickness, maternity, disablement, medical and dependent benefits. Provision also exists for availing himself of free consultation, medicines, specialist treatment, artificial limbs, dentures, spectacles, etc. The scheme, which originally covered workers in some important industrial centres like Bombay, Calcutta and Kanpur, has been gradually extended as indicated at the end of this Section.

Under the Employees' State Insurance Scheme, the total number of employees covered was 38.61 lakhs in 333 centres as on December 31, 1971. There are so far 44 full-fledged Employees' State Insurance Hospitals with 6,666 beds, 20 annexes with 461 beds, and 137 State Insurance Dispensaries functioning in the E.S.I. Corporation buildings. Besides, 15 Employees' State Insurance Dispensaries with 2,463 beds, 2 annexes with 42 beds, and 18 State Insurance Dispensaries were under different stages of construction. In all, 10,147 beds are now available for

the use of insured persons and their families. The total number of beneficiaries of medical benefit, as on December 31, 1971, was 163.70 lakhs.

**Provident Fund:** The introduction of the scheme of Contributory Provident Fund in 1952 was another important step towards the provision of adequate social security to industrial workers. The scheme was initiated in the coal mines in 1947. Since the enactment of the Employees' Provident Fund Act, 1952, the Provident Fund Scheme has been introduced in the industrial establishment employing 50 or more persons in the initial stage. It provided for a contribution on the part of both of employers and workers at the rate of 6½ per cent of wages and dearness allowance. In 1958, the distinction between public and private undertakings was abolished, while in 1960 the employment limit was reduced to 20. Originally the scheme was applicable to six industries, but it was gradually extended to 84 industries covering 2.51 million workers by the end of 1963. The Employees' Provident Fund Act, 1952, was amended in 1971 to provide for the benefit of family pension to its members. The Act, in the amended form, is now called the Employees' Provident Fund and Family Pension Act, 1952. It has been extended to 126 classes of establishments/industries by the end of 1971. The number of subscribers as on September 3, 1971, was 60.51 lakhs against 57.40 lakhs on September 30, 1970. The enhanced rate of contribution of 8 per cent was applicable to 92 industries/classes of establishments. The total contribution to the Fund collected in both exempted and unexempted establishments (including interest and other receipts) was Rs. 2,091.42 crores as on September 30, 1971. The amount refunded by the same date was Rs. 770.96 crores (progression). The rate of interest to be credited on the contributions to the Fund by the members was raised from 5.7 per cent for 1970-71 to 5.8 per cent for 1971-72.

The Family Pension Scheme framed under the Employees' Provident Fund and Family Pension Fund Act, 1952, and introduced from March 1, 1971, is financed by diversion of a portion of employers' and employees' contributions to the Fund amounting to 1.1/6 per cent of worker's total emoluments, with a matching contribution by the Central Government. In the event of premature death while in service, the worker's family is entitled to pension and life assurance benefits. In the event of retirement, the member is entitled to a lump sum payment. From January 1, 1964, a scheme of Death Relief Fund was introduced with the object that the widow and children of the worker, in the event of his sudden death, should get a minimum of Rs. 500/- even if the contributions of the worker and the employer concerned fell short of Rs. 500. The limit was raised to Rs. 750 on August 1, 1969, and the benefit is now given to the nominees/heirs of such persons whose pay

does not exceed Rs. 500 per month at the time of death. Under the Provident Fund Scheme non-refundable advances are permitted for the life insurance premia, house building, relief during lock-outs or closures, purchasing share of consumers co-operative societies, etc. Apart from these, the Provident Fund serves the purpose of channelizing the savings of the working class for developmental purposes under the Plan and helps to check consumption.

**Gratuity:** Gratuity is another measure of social security. At present, however, it is left either to the parties to negotiate the quantum of gratuity or for industrial tribunals to award it when specific disputes are referred to them. The practice, however, is not widespread, but in cases where gratuity was awarded, was linked with the years of service put in by a worker with an employer, subject to a certain maximum.

**Lay-off and Retrenchment Benefits:** As referred to earlier, there is also a statutory obligation on an employer to compensate workers in case of lay-off and retrenchment. These provisions require that an industrial establishment employing more than 50 workers should pay compensation equal to 50 per cent of the total wage for a maximum period of 45 days in a year provided they have continuous service of 240 days. The Act also lays down that when a worker has put in a year's continuous service or more, he should be entitled to a month's notice before retrenchment, or payment in lieu of such notice in addition to gratuity.

**Integrated Social Security:** From the foregoing account, it will be clear that Government has taken steps to provide a measure of social security for different sections of the working class. If the work of these agencies could be combined under one unified administration, it might be possible to provide better benefits to workers without any extra cost either to employers or workers. Recommendations of the working group specially constituted for the purpose are under examination by Government. A Special Officer was appointed in January 1971 to examine the legal, administrative and organizational matters connected with the integration of social security schemes and to prepare a detailed blueprint of integration. The report of the Special Officer has since been received and is under consideration of the Government.

## V. Working and Living Conditions

Congenial working and living conditions play a vital role in promoting labour efficiency, they are a part of improving the conditions of workers, to which the Government's attention is drawn from time to time. The discussion so far covers mainly protection against exploitation and pro-

vision of remuneration as may have a salutary effect on the productive efficiency of the worker. But simultaneously the upkeep of the place of work and machines with which a worker has to operate have to receive attention and so also housing, which forms an important part in the worker's life.

The Government has taken certain legislative measures from time to time to indicate the minimum welfare measures to be provided at the place of work. The Factories Act of 1948, which came into force more or less at the same time as employment in factories came to be recognized as a way of life, seeks to regulate the working conditions at the factory premises. Strangely, the pressure for such legislation came from employers in the U.K., whose competitive capacity was affected by the sub-normal working conditions under which manufacturing was possible in India. With the passage of time, this legislation was revised. A major revision was undertaken in 1954, after the Royal Commission on labour made its recommendations. A complete overhaul of the earlier legislation in factories, mines, and new legislation for plantations covering the same ground was undertaken in the early years of independence. The salient features of the important pieces of legislation on the subject and a brief account of what has been achieved in the field of industrial housing and welfare activities are given in the following paragraphs.

**Protective Legislation:** The Factories Act, 1948 prescribes certain minimum standards of lighting, ventilation, safety, health and guarding machinery to avoid accidents in the course of work. It prohibits the employment of women between certain hours, etc. The Act covers all establishments which use power and employ ten or more persons. It also applies to establishments employing 20 or more persons and not using power. The State Governments have been given power to extend the application of the Act to factories which do not fulfil the above minimum conditions. There is a system of licensing under the Act which requires every factory to register with the State Inspectorate. The Plantation Labour Act, 1951, is another protective legislation brought in for the first time to regulate conditions of work in tea, coffee, rubber and cinchona plantations. There is the usual prohibition of work for children. There are elaborate provisions for laying down standards of welfare, housing, medical facilities and the like. The Mines Act of 1952 regulates the working and safety conditions in mines and provides for the regulation of working hours, over-time payment and holidays with pay. By a separate legislation a labour welfare fund is created for workers in coal and mica mines with appropriate executive agencies to administer the fund.

The Dock Workers (Regulation of Employment) Act 1948 deals with the special problems of dock workers and provides adequate health and safety measures.

There is no central legislation regarding shops and commercial establishments, but most State Governments have legislation in this regard. The implementation of this act is left to local bodies within the State.

**Standing Orders:** A related enactment is the one that deals with the standing orders which are required to be framed by employers and certified by the authorities after consulting workers. These orders lay down classification of workers, manner of intimating to workmen the period and hours of work, shift working, closing and opening of establishments after temporary stoppage, termination of employment, the definition and procedure to deal with misconduct, means of redress to workers against unfair treatment and so on.

It is useful to bring together the common provisions under all these Acts in an attempt to compare working conditions in different kinds of employments.

**Hours of Work:** A uniform 48 hour-week has been prescribed for all categories of adult workers employed in seasonal and perennial factories, daily employment not to exceed 9 hours. In the case of children, the working day is only 4½ hours. The provision under the Mines Act is the same as under the Factories Act, except that for persons who work underground, the working hours in a day cannot exceed 8. In plantations, the working week is 54 hours for adults and 40 hours for adolescents. The shops and commercial establishments are required to see that their employees do not work for more than 8-10 hours a day. State Governments are empowered under the Minimum Wages Act to fix hours of work in scheduled employments and have laid down provisions similar to the Factories Act in such employments. Night work has been prohibited in all these acts for women and children. A minimum rest interval has also been uniformly provided.

**Leave and Holidays:** The system of paid holiday for workers was introduced in perennial factories in 1945. This privilege was extended to all factories in 1948, to plantations in 1951 and to mine workers a year later. The factory and plantation workers are at present entitled to paid annual holidays at the rate of one day for every 20 days of work for adults and one day for every 15 days of work for children. The Mines Act provides for the grant of 14 days' leave with pay to monthly paid employees and 7 days to others. In most States, employees in shops and commercial establishments are statutorily entitled to weekly holidays, privilege leave and casual leave with pay. In addition to leave with pay, the Standing Orders permit absence on leave without pay to the extent of 30 days. There are also some paid festival holidays in different

States, but the number of these holidays varies from region to region.

**Safety, Health and Welfare:** Under the Mines Creche Rules 1959 (as amended in January 1966) it is obligatory for the mines managements to provide creches in every mine where women are employed or were employed in any of the preceding 12 months. At the end of December 1969, creches were provided at 384 non-coal mines.

Special care has been taken to ensure better standards of health, safety and welfare of workers during working hours. The Factories Act stipulates the minimum requirements of cleanliness, lighting and ventilation and provides for the disposal of wastes and effluents, the elimination of dust and fumes and the control of temperature in factories. It seeks to eliminate overcrowding by prescribing minimum cubic feet of space for each worker and lays down in detail the precautions to be taken for ensuring safety. Elaborate provisions have also been made in the Mines Act for safeguarding the health and safety of miners. There is a provision for regulating standards of lighting, ventilation etc., in mines. Adequate sanitary arrangements have to be provided for workers in factories, mines and plantations. Wholesome drinking water requires to be provided in every establishment. Because of the nature of their work, plantation workers have to be adequately protected against rain and cold, and this has also been provided under the Act.

Under the Plantation Act, State Governments are authorized to prescribe the standards of medical facilities which the employer must provide. They are also empowered to make rules requiring the provision of recreational facilities for workers. The standards for canteens, recreational and educational facilities which the employers are required to provide have to be prescribed by rules framed by the State Governments.

Apart from these statutory requirements, certain facilities are left for voluntary action, either by Government, employers' or workers' organization or through special agencies like welfare funds financed by special levies. These relate mainly to facilities outside the undertakings, and cover a wide field like programmes for physical fitness and efficiency of workers, health services, social education, community recreation and cultural activities, holiday homes, workers' co-operatives, etc.

The facilities presently being offered to workers by many progressive private sector employers and in places like Chittaranjan in West Bengal, Sindri in Bihar and Perambur in Madras and many similar public sector undertakings maintain the high standards expected of good employers. The old and established railway system has a wide network of hospitals, dispensaries, schools and recreation centres for employees belonging to different cadres.

Some of the well organized trade unions also provide welfare facilities

to workers. Holiday Homes have been opened at some places. The Posts and Telegraph Department has organized clubs, resthouses, canteens, and tiffin rooms for their employees. Night schools have been provided for the benefit of such of the staff as want to take advantage of them. Where it is not possible to construct hospitals, medical aid is provided through dispensaries and by reserving beds in existing hospitals. The working of welfare schemes in the companies and corporations owned or controlled by the Central Government are supervised by Labour Officers drawn from Central Labour Officers Pool constituted by the Ministry of Labour and Employment.

Apart from the provision of welfare facilities, labour has to be protected from environmental hazards. A number of relevant studies have been undertaken recently to assess systematically the health hazards in selected industries which include textiles, tanneries, shellac, chemicals, mica mining and processing, storage battery manufacture, pottery ceramics, etc. These studies and investigations on occupational diseases have considerable educative value for all concerned. An expansion of such activities on the basis that the effort requires the co-operation of various connected disciplines, has taken place with the establishment of the Central Labour Institute, Bombay, and the three regional institutes at Calcutta, Coimbatore and Kanpur.

In addition to the Central Government, most State Governments also run labour welfare centres in places where there is a concentration of industrial and other workers. The field of activity of the different centres varies. But they generally provide facilities for recreation for men, women and children, reading-rooms and libraries, literary classes for workers, educational facilities for workers' children, handicrafts for workers' families, social and cultural activities, etc. Apart from running welfare centres themselves, some State Governments give financial assistance to centres run by trade unions.

Special organizations exist to promote the health and welfare of workers in coal and mica mines. They are financed through a cess levied on the production of these minerals. The Coal Mines Labour Welfare Fund maintains two hospitals, one at Dhanbad and the other at Asansol, and a chain of regional hospitals and dispensaries, maternity and child welfare centres in important coal-fields. Grants-in-aid from the Fund are permissible to dispensaries maintained by employer and public bodies. Anti-malaria operations conducted by the organization have reduced the incidence of malaria.

The Coal Mines Labour Welfare Fund continued to play its part in improving the living and social conditions of coal miners and their dependents. Three Central Hospitals, one each at Dhanbad, Asansol and Mahendragarh with 300, 350 and 50 beds respectively, continued to provide facilities to workers. In addition, 12 Regional Hospitals have

also been functioning in the various coal-fields. The total number of indoor and outdoor patients treated in the hospitals during the year were 42,983 and 238,336 respectively.

Similar organization for mica miners maintains a number of static and mobile dispensaries in mica mining centres. The other activities of these organizations are, first, to run multi-purpose miners' institutes at mica and coal-fields; secondly, to open welfare centres for women and children of miners, and thirdly, to finance adult education activities and to run primary and middle schools for the benefit of the miners' children.

**Housing:** Apart from the efforts of a few enlightened employers and fewer workers' organizations and certain attempts of Government and local bodies, no co-ordinated action in regard to industrial housing was taken until after 1947. Housing figured prominently in the Industrial Truce Resolution adopted in December 1947, and in 1948 the Government of India announced, as a part of their policy, a scheme for substantial improvement in industrial housing. In 1952, the scheme was revised and a subsidized industrial housing scheme was introduced. Under this scheme, loans were given by the Centre to meet a part of the cost of construction. State Governments, employers, statutory housing boards and co-operative house building societies of industrial workers were eligible for such assistance. By the end of the Second Plan, the construction of about 140,000 tenements costing Rs. 45 crores was approved. About one hundred thousand houses were completed and the rest were at different stages of construction. A further provision of Rs. 32.86 crores was made in the Third Plan with a target of another 80,000 houses.

Under the Annual Plan for 1966-67, an outlay of Rs. 24.06 crores for housing was proposed. The reduced outlay was due to the general directive that housing programmes should be slowed down during the Emergency so as not to draw heavily on the financial resources as well as on building materials required for other emergency needs. During 1966-67, the main effort would be to complete schemes in hand for which commitments have been made. Practically, no new schemes of construction would be undertaken during 1966-67.

Apart from the subsidized industrial housing scheme, the Government of India have other housing projects like the Low Income Group Housing, Village Housing, Plantation Labour Housing, Dock Labour Housing, etc. So far as industries in the public sectors are concerned, whenever a decision to set up a unit is taken, financial provision is made for adequate housing. The housing of plantation workers received considerable attention in 1950. A phased programme of providing houses of reasonable standard by the end of 1960 was accepted by em-

ployers and carried out in larger measure. The Coal and Mica Mines Welfare Funds set apart large sums specifically for housing for miners. Subject to the availability of building materials, fair progress has been achieved in this field since independence.

The up-to-date position regarding the housing facilities for coal-field workers is given below:—

TABLE IX

|                            | <i>Number of houses<br/>constructed<br/>upto 31.12.69</i> | <i>Number of houses<br/>constructed<br/>upto 21.12.70</i> | <i>Number of houses<br/>constructed<br/>upto 31.8.71</i> |

| 1. New Housing Scheme      | 37,149                                                    | 40,289                                                    | 41,627                                                   |
| 2. Low Cost Housing Scheme | 16,424 houses<br>117 barracks                             | 17,375 houses<br>142 barracks                             | 17,964 houses<br>146 barracks                            |

A few States also provide housing facilities for agricultural workers. In Madhya Pradesh, for instance, free house sites are given to agricultural workers. In Tamil Nadu and Andhra, agricultural workers are being provided with similar facilities. The Government of Bihar have a scheme for the construction of houses for landless workers. Improvement in rural housing standards was also a part of the comprehensive rural development programme of the Ministry of Community Development. To provide the necessary technical assistance, a rural housing cell was established by the Central Government in the appropriate Ministry. Similar cells were also set up at the State level.

**Housing Co-operatives:** To encourage self-help in housing, the Government provides developed plots at a small charge, arranges for advice on techniques of house construction to workers or groups of workers and permits small loans for the purchase of materials. This scheme has proved popular in some States and has been a help in the programme of slum clearance.

**The Industrial Housing Scheme:** Achievements under the Industrial Housing Scheme in the First, Second and Third Plans were 57 per cent, 97 per cent and 71 per cent respectively. The main factors that impeded progress were reported to be (i) low priority given by the State Governments to housing projects *vis-a-vis* other development schemes, (ii) non-utilization of even the small allocations made, (iii) diversion of funds to meet other urgent needs, (iv) scarcity of developed land in urban areas, (v) high cost of building material, and (vi) lack of capacity of workers to pay even the subsidized rents.

Out of the total of 159,871 houses built under the scheme till the end of 1967, only 30,498 (19 per cent) had been built by the employers. This explains in part the tardy progress of the scheme. Some of the employers' difficulties were genuine but the response from them has conti-

nued to be discouraging. The original Subsidized Industrial Housing Scheme has been integrated with the housing programme for the economically weaker section of the community since April 1966 and is now known as the Subsidized Housing Scheme for Industrial Workers and Weaker Sections of the Community.

To sum up, labour relations continued to be regulated by the protective legislative measures introduced in earlier Plan periods and the tripartite arrangements. Special mention should be made of the Payment of Bonus Act of 1965, Shops and Commercial Establishments and Labour Welfare Fund Acts in States. A National Safety Council was set up in 1966. Out of the 22 Wage Boards set up covering almost all major industries, 17 have put in reports. Under the Minimum Wages Act of 1948, minimum wages are fixed and periodically revised by State Governments in respect of various agricultural and other trades. A National Commission on Labour was set up in December 1966, to study and make recommendations on various aspects of labour including wages, working conditions, welfare, trade union development and labour management relations.

The National Commission on labour submitted its report to Government on August 28, 1969, and made 300 recommendations/observations covering practically the whole gamut of labour policy and administration. The recommendations of the National Commission on labour were examined and decisions have been taken by Government in respect of 193 out of 300 recommendations of the Commission. With a view to arriving at some broad agreement between the employers and the workers on some of the principal recommendations, the Government organized two separate conferences, one with the employers and the other with the workers in May 1971. Although no specific conclusions could be reached at these conferences, the views expressed therein formed a basis for further discussion at the 27th Session of the Indian Labour Conference which was held in October 1971.

## VI. Labour Administration

With a view to implementing the legislative measures passed on such matters, administrative machinery exists both at the Centre and at State level. The functions of each are discussed separately in the following paragraphs.

**Central Machinery:** The responsibility of the Ministry of Labour and Employment, in respect of the Union list in the Constitution, is full and direct. The activities of the Ministry of Labour and Employment in regard to 'Concurrent' subjects cover laying down policy and co-ordination, control and direction.

The Ministry of Labour and Employment, as at present constituted, consists of the main Ministry (Secretariat) and the following attached and subordinate offices—(i) Directorate-General of Employment and Training, New Delhi, (ii) Labour Bureau, Simla, (iii) Office of the Chief Labour Commissioner, New Delhi, (iv) Office of the Coal Mines Welfare Commissioner, Dhanbad, (v) Office of the Coal Mines Provident Fund Commissioner, Dhanbad, (vi) Office of the Welfare Commissioner, Mica Mines Labour Welfare Fund, Dhanbad, (vii) Office of the Chairman, Mica Mines Labour Welfare Fund Advisory Committee for Andhra, Nellore, Bhilwara and Rajasthan, (viii) Office of the Chief Inspector of Mines, Dhanbad, (ix) Office of the Chief Adviser Factories, New Delhi; (x) Office of the Controller of Emigrant Labour, Shillong, (xi) Office of the Director General Employee's State Insurance Corporation, New Delhi (Autonomous Body), (xii) Office of the Central Provident Fund Commissioner, New Delhi, (xiii) Gorakhpur Labour Organisation, Gorakhpur. and (xiv) Central Board for Worker's Education (Semi Autonomous). The functions of some of the offices/organizations are described below\*

**Ministry of Labour and Employment (Secretariat):** The Secretariat of the Ministry of Labour and Employment considers all questions concerning labour as far as the Government of India is concerned. It is the Central machinery for the formulation of labour policy, for enforcement of labour laws and for promotion of labour welfare. The policy-making activity covers subjects like closer co-operation between labour and management, better industrial relations and increasing production. It co-ordinates the activities of the State Governments in the sphere of labour. It also forms the Secretariat for the Tripartite Labour Conferences and the Industrial Committees, convened by the Government of India and is the channel for India's participation in the activities of the International Labour Organization (I.L.O.). But apart from these activities, the Ministry has recently accepted direct responsibility for evaluation and implementation of labour laws, awards, agreements, settlements, Code of Discipline in Industry, etc., and for evaluating the results achieved by these measures with suitable agencies set up by the State Governments.

**Directorate-General of Resettlement and Employment:** The Directorate was set up in 1945 with a view to resettling demobilized ex-servicemen in civilian occupations. Very soon it had to take upon itself the task of resettling displaced persons and has now developed into an agency for employment assistance and training. The organization has built up a

---

\*Where the name of the office clearly defines its functions and no other functions are entrusted to it, the details of the organization and its functions are not described.

network of employment exchanges and training centres throughout the country. In 1956-57, the administration of these exchanges and training centres was transferred to the State Governments, though the laying down of standards and all policy matters relating to the functioning of the exchanges, collection of employment market information and training institutes continue to be the responsibility of the Directorate. The Directorate provides the Secretariat for the National Council for Training in Vocational Trades, which examines training policies and the implementation of training programmes. It also deals with the Central Committee on Employment which examines the working of employment policies.

**Labour Bureau:** This organization was set up in October 1946. It is responsible for (i) collection, compilation and publication of labour statistics; (ii) maintenance of consumer price index numbers for industrial and agricultural workers; (iii) conducting of *ad-hoc* enquiries and preparation of reports thereon; (iv) compilation and publication of reports on the working of Factories Act, 1946, Minimum Wages Act, 1948, and Indian Trade Union Act, 1926; and (v) publication of *Indian Labour Journal* (monthly), *Indian Labour Year Book* (annual), etc.

**Office of the Chief Labour Commissioner:** The Government of India appointed a Chief Labour Commissioner in 1945 to look after the welfare of employees and conciliation of industrial disputes in Central sphere undertakings. Its main functions are: (i) settlement of labour disputes; (ii) supervision of labour welfare; (iii) watching the implementation awards of Industrial Tribunals and Settlements arrived at in conciliation and submission of periodical reports regarding their implementation; (vi) verification of membership figures of Central Trade Union Organizations and such other related functions which may be entrusted to it by the Ministry.

**Office of the Chief Inspector of Mines:** The functions of this office are: (i) enforcement of the Mines Act, 1952, and the Rules and Regulations made thereunder; (ii) inspection of mines; (iii) investigation of accidents; (iv) inspection of electrical installation and machinery; (v) technical advice to mine owners; (vi) prosecution in cases of violation of statutory provision; (vii) collection of statistics under the Mines Act; and (viii) enforcement of the Maternity Benefit Act, 1951, and the rules framed under it in mines other than coal-mines. The Inspectorate of Mines published periodical reports about matters of interest to mining industry.

**Office of the Chief Adviser, Factories:** The organization was set up

in 1945 to function as a service capable of advising all concerned on matters relating to the health, welfare and safety of workers. It deals with all questions relating to the administration of the Factories Act and the rules framed under it; training of Factory Inspectors and Safety Officers; industrial health; surveys of toxic hazards; environmental problems in factories; studies relating to productivity and work and method studies; housing of industrial labour and administration of safety; health and welfare schemes and the Dock Workers (Regulation of Employment) Act, 1961. The organization also offers (i) Technical Service; and (ii) Information Service. It administers the Indian Dock Labourers Act, 1934, and the Indian Dock Labourers Regulations, 1948, through the Inspectors of Dock Safety, at Calcutta, Bombay and Madras.

The organization is responsible for the setting up of the (a) Central Labour Institute at Bombay comprising: (i) A Museum of Industrial Safety, Health and Welfare; (ii) an Industrial Hygiene Laboratory (iii) a training centre; (iv) a Library-cum-Information Centre; (v) a Productivity Centre; (vi) a Training-within-Industry Centre; (vii) an Industrial psychology Section; (viii) an occupational Physiology Section; and (b) Three Regional Museums of Industrial Safety, Health and Welfare at Calcutta, Coimbatore and Kanpur

**Office of The Director-General, Employees' State Insurance Corporation:**

This is a statutory corporation set up to administer the Employees' State Insurance Act, 1948, which provides for sickness, maternity, disablement and dependents benefits as well as medical benefit to workers employed in factories. Medical care is also provided for families of workers in certain places. The Corporation directly renders all the services except medical benefit where such services are organized by the State Governments.

**Office of the Central Provident Fund Commissioner:** This organization was set up in April 1953, for the administration of the Employees' Provident Fund Act, 1952, and the scheme framed under it. The Central Government constituted a Tripartite Board of Trustees to administer the Employees' Provident Fund. The fund vests in and is administered by the Board, a body corporate, consisting of a Government-nominated administered Chairman, nominees of the Central Government and State Governments and representatives of the All-India Employers' and Employees' Organizations. The Central Provident Fund Commissioner is subject to the general control of the Central Board of Trustees constituted under the scheme. He is assisted by 20 Regional Provident Fund Commissioners who have their offices for the most part in the capitals of various States.

**Central Board for Workers' Education:** The Board was set up as a semi-autonomous body in September 1958 and was registered under the Societies Registration Act of 1860 to administer the Workers' Education Scheme. The programme of the Central Board of Workers' Education operates in three tiers. First, education officers are selected in open competition and are given training. Next, selected workers are prepared as teachers. Finally, worker-teachers, on completion of their training, return to the establishments and conduct a programme for the rank and file of workers in their respective units, work-places or localities. By 1969, there were 30 Regional and Sub-Regional Centres for training; 18,251 worker-teachers had been trained; a total of 10 lakhs of workers had been trained.

During 1971, 2,845 worker-teachers and 168,943 workers were trained. Grants-in-aid amounting to Rs. 1.68 lakhs were also given to 132 unions/institutions, to organize their own workers' education programme. The Indian Institute of Workers' Education which was set up in 1970 in Bombay to serve as a demonstration and information centre, conducted refresher courses for education officers and organized training programmes in various docks and ports.

**States Machinery:** As labour is a concurrent subject, all the States have set up organizations for the administration and enforcement of the labour laws in force in their territories and for the collection, compilation and dissemination of statistical and other information relating to labour. All the States have appointed Labour Commissioners for purposes of administration of labour laws and welfare activities in their respective areas. In the discharge of their functions, the commissioners are generally assisted by Deputy Labour Commissioner and/or Assistant Labour Commissioners. In West Bengal, labour laws are administered by three Directorates under the labour department, viz., the Labour Directorate, the Shops and Establishments Directorate, and the Factory Directorate. Most States have appointed Chief Inspectors of Factories and Chief Inspectors of Boilers to administer the Factories Act, 1948, and the Indian Boilers Act, 1923, respectively. Commissioners for workmen's compensation under the Workmen's Compensation Act, 1923, and Registrars of Trade Unions under the Indian Trade Union's Act, 1926, have been appointed in most States. The Labour Commissioner often supervises the functions of various officers enumerated above. For example, in Bihar, the Commissioner of Labour discharges the functions of the Commissioner for Workmen's Compensation, the Registrar of Trade Union, the Certifying Officer under the Industrial Employment (Standing Orders) Act, 1946, and the Regional Provident Fund Commissioner. The Chief Inspector of Factories and the Chief

Inspector of Boilers are also under his administrative control. In Maharashtra, the Commissioner of Labour is also the Certifying Officer under the Industrial Employment (Standing Orders) Act, 1946, and the Chief Conciliator under the Bombay Industrial Relations Act, 1946. In Rajasthan, the Labour Commissioner is also discharging the functions of Conciliation Officer for the State.

In certain States, special machinery has been set up for the collection of labour statistics, while in others the authorities listed above perform these duties as well. In Tamil Nadu, labour statistics are collected by the Chief Inspector of Factories, while in the Delhi territory, such statistics are collected by the Bureau of Economics and Statistics. In Assam labour statistics are collected by the Directorate of Economics and Statistics and also by the officers of the Labour Commissioner and the Chief Inspector of Factories. In Bihar, Madhya Pradesh and Maharashtra, labour statistics are compiled under the guidance of statistical authorities. Such authorities collect statistics regarding employment, hours of work, attendance and wages and earnings under the Industrial Statistics Act, 1942, (now replaced by the Collection of Statistics Act, 1953). In other States, according to information available in the Labour Bureau, labour statistics are collected through officers appointed for the administration of labour laws or by the Labour Department directly. For instance, statistics of employment, accidents, etc., under the Factories Act, 1948, and of wage bills and earnings under the Payment of Wages Act, 1936, are collected by the Chief Inspectors of Factories. The Registrars of Trade Unions collect statistics relating to trade unions, their membership, funds, etc. The Commissioners for Workmen's Compensation are in charge of the collection of statistics relating to accidents, compensation paid, etc., under the Workmen's Compensation Act, 1923.

Competent authorities have been appointed by the various State Governments under the Minimum Wages Act, 1948, to ascertain from time to time the Consumer Price Index Number applicable to persons covered by the scheduled employment.

While these are directly the functions for which administrative arrangements have to be made by the Ministry in charge of Labour at the Centre and in the States, there are certain judicial/semi-judicial offices which have to be constituted by the Ministry as circumstances require. In some cases, Standing Industrial Tribunals have been constituted by the Governments concerned while in others Wage Boards have been set up or enquiry Committees/Commissions appointed. Arrangements to serve such standing or *ad-hoc* bodies is also the responsibility of the concerned Ministry.

## VII. India and the International Labour Organization

No account of labour in India is complete without a reference to India's connection with the International Labour Organization and the benefits that have flowed from it. As an original signatory to the Treaty of Versailles, India was a party to Article XIII of the Treaty which created the I.L.O. and thus became a member of the Organization since its foundation in 1919. The association has continued uninterrupted and India is one of the twelve permanent members of the Governing Body of the I.L.O. India is also a member of each of the Industrial Committees so far set up by the I.L.O. to examine the special problems relating to particular industries.

The International Labour Organization operates through the International Labour Conferences consisting of delegates from all the Member States, the Governing Body and the International Labour Office. The work of the Conference and Governing Body is supplemented by Regional Conferences, Industrial Committees and Analogous Bodies, Committees of Experts, Panels of Consultants and Special *ad-hoc* Conferences and Meetings. Most of these bodies are tripartite in character and consist of representatives of Governments, employers and workers. The regional conferences which were convened largely owing to India's efforts, aimed at tackling special problems relating to different regions, keeping in view the special needs and difficulties of the countries at different stages of economic and social development. Regional conferences are now convened for Africa, Asia, America, Europe and the Near and Middle East. The Asian Regional Conference has met five times so far. The first session called the 'Preparatory Session' was held in India in 1947. Another session of the Conference was held in India in 1957. The International Labour Office, whose headquarters are in Geneva, is assisted by 12 Branch Offices in addition to a number of Field Offices and National Correspondents. A Branch Office of the I.L.O., was established in India in 1928, and has functioned since. Besides acting as a major link in the world wide network of the I.L.O., the Branch Office has acted as a clearing house of information and maintains business contacts with Government authorities and employers' and workers' organizations. The office has brought out a number of publications covering various aspects of the labour problems in India.

The impact of the I.L.O. and its other agencies on the development of social and labour policies in India has been considerable. The holding of the International Labour Conference annually and the selection by the Government of India of the non-government delegates and advisers has acted as a catalytic agent in promoting organizations of workers and employers and their national federations. This process has been stimulated further by the establishment of other tripartite committees of the

I.L.O. and particularly Industrial Committees. In determining the place of 'Labour' in the constitutional structure, there is evidence to show that one of the reasons for deciding to have current jurisdiction on labour matters by Central and State Governments was the ratification of Conventions adopted by the I.L.O. Another instance of the impact of the I.L.O. is the setting up in India of the Tripartite Indian Labour Conference and the Industrial Committee with more or less similar functions as those of the I.L.O. Organization and Industrial Committees.

**International Labour Code:** The main impact of the I.L.O. has been through its conventions and recommendations on social and labour matters. The Conventions and Recommendations adopted by the International Labour Conference since 1919, with other decisions of the Conference, the various Industrial Committees and similar committees and commissions together form what is now known as "The International Labour Code." The Conference has so far adopted 119 Conventions and 119 Recommendations and about 2,750 ratifications have been registered at the I.L.O. headquarters. India has so far ratified the 29 Conventions that are listed in Appendix IV.

It would not, however, be fair to judge the influence of the I.L.O. on India through the ratified conventions alone, because some of the conventions have no applicability to India. Similarly, there are others which have not been ratified for technical rather than substantial reasons. Also, where immediate ratification is not possible, measures are taken constantly to make ratification possible at a future date. A committee called the Committee on Conventions exists for examining on a continuing basis the International Labour Conventions and Recommendation with a view to accelerating the process of their implementation.

The benefit of association with the I.L.O. has reached India also through the various technical assistance programmes administered by the I.L.O. She has received technical assistance from the I.L.O. since 1951 in various fields like social security, training within industry, vocational training, employment service, productivity, etc. This has not, however, been one-way traffic so far as India is concerned. Indian experts in various fields like co-operation, cottage industries, labour statistics, personnel administration, employment services, manpower problems etc., have been selected by the I.L.O. for work in other countries like Afghanistan, Burma, Sri Lanka, the Philippines, Indonesia, etc., and many African countries. India has offered training facilities to people from other countries selected under the I.L.O. Fellowship Programme, as she has sent and is sending her own nationals abroad for training under the auspices of the I.L.O.

**Appendix I****Code of Discipline in Industry Towards Industrial Progress**

**I. To Maintain Discipline In Industry** (both in public and private sectors) there has to be (i) a just recognition by employers and workers of the rights and responsibilities of either party, as defined by the laws and agreements (including bipartite and tripartite agreements arrived at all levels from time to time) and (ii) a proper and willing discharge by either party of its obligation consequent on such recognition.

The Central and State Governments, on their part, will arrange to examine and set right any shortcomings in the machinery they constitute for the administration of labour laws.

**II. To Ensure Better Discipline In Industry:**

**A. Management and Union(s) Agree** (i) that no unilateral action should be taken in connection with any industrial matter and that disputes should be settled at appropriate level; (ii) that the existing machinery for settlement of disputes should be utilized with the utmost expedition; (iii) that there should be no strike or lock out without notice; (iv) that affirming their faith in democratic principles, they bind themselves to settle all future differences, disputes and grievances by mutual negotiation, conciliation and voluntary arbitration; (v) that neither party will have recourse to (a) coercion, (b) intimidation, (c) victimization, or (d) go-slow; (vi) that they will avoid, (a) litigation, (b) sit-down and stay-in strikes, and (c) lock outs; (vii) that they will promote constructive co-operation between their representatives at all levels and as between workers themselves and abide by the spirit of agreements mutually entered into; (viii) that they will establish upon a mutually agreed basis, a grievance procedure which will ensure a speedy and full investigation leading to settlement; (ix) that they will abide by various stages in the grievance procedure and take no arbitrary action which would by-pass this procedure; and (x) that they will educate the management personnel and workers regarding their obligations to each other.

**B. Management Agrees** (i) not to increase work loads unless agreed upon or settled otherwise; (ii) not to support or encourage any unfair labour practice such as (a) interference with the right of employees to enrol or continue as union members, (b) discrimination, restraint or coercion against, any employee because of recognized activity of trade unions, and (c) victimization of any employee and abuse of authority in any form; (iii) to take prompt action for (a) settlement of grievances, and (b) implementation of settlements, awards, decisions and orders;

(iv) to display in conspicuous places in the undertaking the provisions of this Code in local language (s); (v) to distinguish between actions justifying immediate discharge and those where discharge must be preceded by a warning, reprimand, suspension or some other form of disciplinary action and to arrange that all such disciplinary action should be subject to an appeal through normal grievance procedure; (vi) to take appropriate disciplinary action against its officers and members in cases where enquiries reveal that they were responsible for precipitate action by workers leading to indiscipline; and (vii) to recognize the union in accordance with the criteria (Annexure I) evolved at the 16th session of the Indian Labour Conference held in May 1958.

C. Union(s) Agree (i) not to engage in any form of physical duress; (ii) not to permit demonstrations which are not peaceful and not to permit rowdyism in demonstration; (iii) that their members will not engage or cause other employees to engage in any union activity during working hours, unless as provided for by law, agreement or practice; (iv) to discourage unfair labour practices such as (a) negligence of duty, (b) careless operation, (c) damage to property, (d) interference with or disturbance to normal work, and (e) insubordination; (v) to take prompt action to implement awards, agreements, settlements and decisions; (vi) to display in conspicuous places in the union offices, the provisions of this Code in the local language(s); and (vii) to express disapproval and to take appropriate action against office-bearers and members for indulging in action against the spirit of this Code.

#### ANNEXURE I

##### Criteria for Recognition of Unions

1. Where there is more than one union, the unions claiming recognition should have been functioning for at least one year after registration. Where there is only one union, this condition would not apply.
2. The membership of the union should cover at least 15% of the workers in the establishment concerned. Membership would be counted only for those who had paid their subscriptions for at least three months during the period of six months immediately proceeding the reckoning.
3. A union may claim to be recognized as a representative union for an industry in a local area if it has a membership of at least 25% of the workers of that industry in that area.
4. When a union has been recognized, there should be no change in its position for a period of two years.
5. Where there are several unions in an industry or establishment the one with the largest membership should be recognized.

6. A representative union for an industry in an area should have the right to represent the workers in all the establishments in the industry, but if a union of workers in a particular establishment has a membership of 50% or more of the workers of that establishment it should have the right to deal with matters of purely local interest, such as, the handling of grievances pertaining to its own members. All other workers who are not members of that union might either operate through the representative union for the industry or seek redress directly.

7. In the case of trade union federations which are not affiliated to any of the four central organizations of labour, the question of recognition would have to be dealt with separately.

8. Only unions which observed the Code of Discipline would be entitled to recognition.

## Appendix II

### Inter-Union Code of Conduct\*

We, the representatives of four Central Labour Organizations, namely, I.N.T.U.C., A.I.T.U.C., H.M.S. and U.T.U.C. agree to observe the following basic principles for maintaining harmonious inter-union relations:

- (1) Every employee in an industry or unit shall have the freedom and right to join a union of his choice. No coercion shall be exercised in this matter.
- (2) There shall be no dual membership of unions. (In the case of Representative Unions, this principle needs further examination).
- (3) There shall be unreserved acceptance of, and respect for, democratic functioning of trade unions.
- (4) There shall be regular and democratic elections of executive bodies and office-bearers of trade unions.
- (5) Ignorance and/or backwardness of workers shall not be exploited by any organization. No organization shall make excessive or extravagant demands.
- (6) Casteism, communalism and provincialism shall be eschewed by all unions.
- (7) There shall be no violence, coercion, intimidation, or personal vilification in inter-union dealings.
- (8) All Central Labour Organizations shall combat the formation or continuance of Company Unions.

---

\* Adopted on May 21, 1938.

**Appendix III****Industrial Truce Resolution\***

Realizing that a grave emergency has overtaken the nation on account of the Chinese aggression and the need has arisen for taking urgent steps in every direction, to prepare adequately for the defence of the country, and repelling the invasion of its territory, the Joint Meeting of all Central Employers' and Workers' Organizations, held today, November, 3, 1962 resolves that no effort shall be spared to achieve maximum production, and managements and workmen will strive in collaboration in all possible ways, to promote the defence effort of the country and reaffirms their pledge of unstinted loyalty and devotion to the country. Towards these ends, the following steps shall be taken:—

**I. Climate**

It is important that a suitable climate should be created and preserved for ensuring sustained effort and resolute action in pursuance of the aforesaid aim. Both sides should exercise restraint and forbearance, so that nothing is allowed to come in the way of their single minded and concerted endeavour in support of the defence of the country. Positive steps should be taken to promote constructive co-operation between management and workers in all possible ways.

**II. Industrial Peace**

- (i) Under no circumstances shall there be any interruption in/or slowing down of production of goods and services.
- (ii) In respect of their economic interests both workers and employers will exercise voluntary restraint and accept the utmost sacrifice, in an equitable manner, in the interest of the nation and its defence efforts.
- (iii) There should be maximum recourse to voluntary arbitration and adequate arrangements should be made for the purpose. If necessity for a reference to adjudication arises, the processes connected with it should be completed with the utmost promptness.
- (iv) The industries mentioned in the First Schedule to the Industrial Disputes Act, 1947, and such other industries as may be considered necessary, e.g., petroleum and its products, chemicals, etc., may be declared as public utility services under sub-clause (vi) of clause (s) of Section 2 of the Act.
- (v) All complaints pertaining to dismissal, discharge, victimization

\* Adopted at the Joint Meeting of Central Organizations of Employers and Workers held in New Delhi on November 3, 1962.

and retrenchment of individual workmen, not settled mutually should be settled through arbitration. For this purpose, the officers of the conciliation machinery may, if the parties agree, serve as arbitrators. Dismissals and discharges of workmen should, however, be avoided as far as possible.

- (vi) The labour administration at the Centre and States should be stream-lined so that grievances and disputes are settled promptly and cordial industrial relations are maintained.

### III. Production

- (i) All impediments in the way of better and fuller utilization of men, machinery and materials should be removed. There should be no idle plant capacity or waste. Managements should exercise the maximum economy in their operations.
- (ii) To maximize production, establishments should work, wherever possible, extra shifts, extra hours or on Sundays and holidays by mutual agreement. Full co-operation should be extended by all in this respect. All advantages accruing to industry out of the extra effort of the workers should go to the consumer and/or be made available for defence efforts.
- (iii) Absenteeism and turnover should be discouraged and reduced to the minimum. Negligence of duty, careless operation, damage to property and interference with or disturbance to normal work should be denounced by the unions. Similarly, any lapse on the part of the management that contravenes the spirit of the defence effort should be condemned and put right forthwith.
- (iv) Technical and skilled personnel in short supply should be switched over to emergent work having a bearing on defence. Simultaneously, steps should be taken to increase the supply of technical and skilled personnel through apprenticeship and other training programmes.
- (v) In the production drive the well-being and health of the working class should not be ignored.

### IV. Price Stability

- (i) Every effort should be made to ensure that prices of industrial goods and essential commodities are not allowed to increase.
- (ii) To ensure supply of essential commodities at fair prices to the working class steps should be taken, whenever necessary, to organize Consumers' Co-operatives in each unit and in industrial areas.

### V. Savings

- (i) The imperative necessity of increasing savings in the larger interest

of the country should be brought home to workers and managements and arrangements to facilitate greater savings should be provided forthwith.

- (ii) Workers may be persuaded to contribute to the National Defence Fund and/or invest in Defence Bonds every month an amount equivalent to at least one day's earnings. Managements also agree to contribute liberally towards National Defence Fund and/or invest in Defence Bonds; the basis of their contribution will be settled in consultation with Government.

#### Appendix IV

The following are the 29 Conventions of the International Labour Organization that India has so far ratified:

1. No. 1, Hours of Work (Industry) Convention, 1919.
2. No. 2, Unemployment Convention, 1919.
3. No. 4, Night Work (Women) Convention, 1919.
4. No. 5 Minimum Age (Industry) Convention, 1919.
5. No. 6 Night Work of Young Persons (Industry) Convention, 1919.
6. No. 11 Right of Association (Agriculture) Convention, 1921.
7. No. 14 Weekly Rest (Industry) Convention, 1921.
8. No. 15 Minimum Age (Trimmers and Stockers) Convention, 1921.
9. No. 16 Medical Examination of Young Persons (Sea) Convention, 1921.
10. No. 18 Workmen's Compensation (Occupational Diseases) Convention, 1925.
11. No. 19 Equality of Treatment (Accident Compensation) Convention, 1925.
12. No. 21 Inspection of Emigrants Convention, 1926.
13. No. 22 Seamen's Articles of Agreement Convention, 1926.
14. No. 26 Minimum Wage-Fixing Machinery Convention, 1928.
15. No. 27 Marking of Weight (Packages transported by Vessels) Convention, 1929.
16. No. 29 Forced Labour Convention, 1930.
17. No. 32 Protection Against Accident (Dockers) Convention, (Revised), 1932.
18. No. 41 Night Work (Women) Convention, (Revised), 1934.
19. No. 42 Workmen's Compensation (Occupational Diseases) Convention (Revised), 1934.
20. No. 45 Underground Work (Women) Convention, 1935.
21. No. 80 Final Articles Revision Convention, 1946.
22. No. 81 Labour Inspection Convention, 1948.
23. No. 88 Employment Service Convention, 1948.
24. No. 89 Night Work (Women) Convention, (Revised), 1946.
25. No. 90 Night Work of Young Persons (Industry) Convention,

(Revised) 1948.

26. No. 100 Equal Remuneration Convention, 1951.
27. No. 107 Indigenous and Tribal Regulations Convention, 1957.
28. No. 111 Discrimination (Employment and Occupation) Convention, 1958.
29. No. 116 Final Articles Revision Convention, 1961.

## INCOME, CAPITAL FORMATION AND SAVINGS

An analysis of the trends in national and per capita income, capital formation and savings can throw significant light on economic growth and its major determinants. The rate of growth of national income is commonly employed as a measure of the pace at which an economy has been advancing. This concept is a simple and analytically serviceable, though not, an adequate measure of economic progress. Its inadequacy is, however, obvious. First, there is often a large margin of error emanating from unsatisfactory bases and arbitrary assumptions involved in certain sectoral estimates; and secondly, it fails to portray qualitative changes. Economic growth is a generic term and comprehends a wide range of improvements pervading the entire life and living in a community. Improvements in the physical and mental ability to work, development of initiative and enterprise in a community, modernization of institutional arrangements, advancement in the level of techniques of production and structural realignments in the productive apparatus, and more equitable distribution of incomes are some of the more important facets of economic progress, all contributing to the end-result of making the community more prosperous.

Some of these are qualitative improvements and cannot be reduced to a common measure. The normal technique of national income estimation fails to comprehend these and express them in quantitative terms. While all this is true, the use of national income estimates has the merits of identifying the components so vital to the analysis of sectoral growth of an economy. It also enables concentrated attention on the readily measurable and causally inter-related aggregates like income, consumption, investment and savings. Further, after allowing for changes in population, the rate of growth of per capita income provides an index of the rise in productivity and standard of living and, therefore, of economic welfare in a community. It is for these reasons that in the analysis presented here, the rates of growth of national and per capita income have been used as indicators of economic progress and related to the analysis of investment and savings trends, their major determinants.

### I. National and Per Capita Real Income

Each sector of the economy *viz.*, agriculture, industry, mining, trade, transport, banking and other services, whose development has been discussed in earlier chapters, employs human and material resources and contributes to the aggregate flow of goods and services during a given

time-period which may be normally specified as a calendar year. This aggregate flow of goods and services represents the aggregate income earned by factors of production employed during the year, and is termed as national income in technical parlance. It is a sum of domestic output counted without duplication *i.e.* value added by factors domestically employed and originating within the economy and net income earned from financial investments abroad. Changes in nominal national income are measured at current prices and in real national income at constant prices. A distinction is usually made between *gross* and *net* national income; the former does not, while the latter does, allow for capital consumption or depreciation of the stock of capital during the accounting period. What is relevant for the analysis of economic growth is the *net* national income whose rate of growth is indicative of the pace at which the economy has been growing.

The rate of growth of *net* national income when compared with the rate of growth of population indicates whether the economy is declining, stagnant or developing. If the rate of growth of national income is lower than the rate of growth of population, per capita income declines, the economic condition of the people (on an average) deteriorates and the economy exhibits a declining trend. When net national income grows at a rate equal to the rate of growth of population, per capita income remains constant and the economy continues to stagnate. It is only when *net* national income grows at a rate faster than the rate of growth of population that per capita income depicts a rising trend. The community is able to improve its living standard and add to its stock of capital, and the economy moves on the path of a rising level of activity and productivity. A developing economy is characterized by such a trend.

An analysis of trends on the lines indicated above presupposes the availability of fairly reliable and comparable time-series of data on national *real* income, population and per capita *real* income. In India, the first attempt to estimate national income and per capita income was made for the year 1867-68 by Dadabhai Naoroji. This was followed by several intermittent efforts by individuals — officials as well as non-officials. The Table I sets forth the more important estimates made for particular years before World War II.

All these estimates are at current prices and differ widely in territorial coverage, conceptual basis, method of estimation and basic data used. They do not provide a series of comparable estimates adequately reliable to study the growth of Indian economy over the period. In view of this deficiency of national income statistics, some research workers have, of late, attempted to study the trends during the period by following two alternative methods: one is based on available time-series data on physical units of output and the other on a time-series of national and per capita

TABLE I

| Estimator                            | Year    | Estimates                       |                        |                            |
|--------------------------------------|---------|---------------------------------|------------------------|----------------------------|
|                                      |         | National income<br>(Rs. crores) | Population<br>(crores) | Per capita income<br>(Rs.) |
| Dadabhai Naoroji (1)                 | 1867-68 | 340                             | 17.0                   | 20                         |

- (2) For a critical review of these estimates see: V.K.R.V. Rao: *An Essay on India's National Income, 1925-29*, London 1939; also the section on *National Income Estimates* in Daniel Thorner's paper on "Long-term trends in output in India" published in *Economic Growth: Brazil, India and Japan* edited by Simon Kuznets and others, Duke University Press, 1955.

incomes specially constructed by moving backward and forward the later estimates, like that of Dr. V.K.R.V. Rao for 1931-32 or the official estimate for 1948-49, with the help of indices of prices, agricultural production, business activity, etc. Proceeding on the former basis, Daniel Thorner draws the following inference from his study of the trends in Indian economy during the pre-independence period:

"In retrospect, the net effect of British rule was to change drastically the social fabric of Indian agriculture, but to leave virtually unaffected the basic process of production and the level of technique. The upper strata of the new agrarian society benefited handsomely. The position of the cultivators deteriorated. Capital needed for the development of agriculture was siphoned off and the level of total output tended towards stagnation.

"By contrast with agriculture, there seems little doubt that total non-agricultural activity has been rising in India over the last sixty years. The contribution to the total national product from medium industry, domestic commerce, and the services has been on the increase. Whether, in view of the static condition of agriculture and the growing population, this expansion of other sectors has been sufficiently large to maintain the level of per capita total product, is a difficult question to answer . . . Some hold that in the twentieth century per capita income has been rising; others that it has not been rising. There is a third logical possibility that per capita income has been declining. Until knowledge of India's economy and its evolution comes to rest on a more solid foundation, it would seem premature to rule out this third possibility"\*.

The second method has been followed by the following research workers who have constructed as many as 14 series-estimates. These are:

TABLE II

|                              | Period covered     | Number of series constructed    |
|------------------------------|--------------------|---------------------------------|
| H. C. Arora and (1)          |                    |                                 |

These series-estimates have been reviewed and interpreted by M. Mukherji of the Indian Statistical Institute, Calcutta in a paper\* submitted to the Second Indian Conference on Research in National Income held at Delhi in 1960. His findings are quoted below:

"Not much validity attaches to anyone of the individual series considered here . . . It is safer, however, to examine all the available series before drawing any conclusion and in this context, Arora and Iyengar's all three estimates, Suren Patel's series and K. Mukherjee's two series deserve consideration.

"All the six series just mentioned depict a gradual growth of per capita real national income over the period 1900 to about 1925. For the remaining period Patel's figures show a steady decline. In the remaining five series, there is some kind of a stability of per capita *real* income over the period 1925-1940 in rough way, a decline during 1940-50 roughly, and a rise to the peak reached ever earlier during the following years under consideration. Thus Patel's hypothesis though reasonable is unlikely to be true, if one has to accept all the available evidence. On the other hand, it seems likely that the general picture presented by the five other series gives a more or less realistic picture of what happened during the period. Thus one may conclude that our per capita income grew over the first half of the half century under review, then remained more or less steady upto the Second World War, declined to some extent during the next decade and overtook and surpassed the highest levels reached in the past during the last few years. Thus, on the whole, we get a slight rise over the half century with periods of growth,\*\* stagnation and decline."

The break in the fifties from the declining trend of the forties is also brought out by the official estimates\* of national and per capita *real* incomes prepared on a consistent basis for each of the years in the post-independence period. The Table below shows that during 1948-49 to 1950-51 (pre-plan period) national *real* income grew at the compound rate of 1.2 per cent per year while population increased at the compound rate of 1.6 per cent per year. Consequently, per capita *real* income registered a decline. In contrast, during the first fourteen years of economic planning (1951-65) national *real* income rose at the compound rate of 3.9 per cent per annum; the corresponding rate of growth for

\*That the first quarter of the current century was a period of mild growth is also inferred by Shah and Khambatta (*op. cit.* pp. 203-4) on a comparison of the average level of per capita *real* income during the two periods 1900-14 and 1914-22. They write: "The picture that we have depicted, though a dark one, is not too gloomy, for it reveals a slight but distinct advance — We have not been going backwards nor is it that we are remaining stationary. On the contrary, the present enquiry shows a real increase of Rs. 2-2-0 per head in course of about fifteen years."

|                                                          |                      |                        |
|----------------------------------------------------------|----------------------|------------------------|
|                                                          | Pre-War<br>(1900=14) | Post-War<br>(1914=133) |
| **Gross Income per head at pre-war (1900-14) price level | Rs. 36               | Rs. 38-2-0             |

population being 2.1 per cent per annum, per capita *real* income increased at a compound rate of 1.8 per cent per year. The next two years were characterized by severe setbacks to the growth of agricultural and industrial production and as a result national income showed a substantial decline in 1965-66, followed by a marginal improvement in 1966-67. The ensuing year, however, witnessed a marked recovery. According to the latest available estimates — these relate to 1968-69 — the total *real* national income shows a rise of 91 per cent and *real* per capita income of 31 per cent over the 1950-51 level. The annual rate of increase (compound) during these eighteen years works out to 3.6 per cent for aggregate national income and 1.5 per cent for per capita income.

\*At 1948-49 prices.

\*\*Estimates implicit in the derivation of per capita income.

With the commencement of economic planning in the fifties, per capita *real* income has undoubtedly shown an upward trend, but the rate of its annual growth so far has been slow. The Fourth Plan document, therefore, postulates a vigorous effort to step up the rate of per capita income in the coming years. The 1968-69 level of national income is expected to get doubled by 1980-81. And since population is expected

\*The official estimates of national income at 1948-49 prices prepared annually for the years since 1948-49 follow the method and factual bases recommended by the National Income Committee appointed by the Government of India in 1949. The committee comprised Prof. Mahalanobis as Chairman, Prof. D. R. Gadgil and Prof. V. K. R. V. Rao as members. Its First Report was published in 1951 and the Final Report in 1954. The latter reviewed the estimate made for 1948-49 in the First Report and presented a revised estimate for 1948-49 together with further estimates for 1949-50, and 1950-51. The methodology followed was discussed in detail, sources of data used indicated and steps to be taken for data improvement recommended. The Report recognized the large margin of error emerging from the paucity of data for certain sectoral estimates, which as estimated in the Report ranged between  $\pm 10\%$  for factory establishments, mining, Railways, organized banking and Government sectors to as much as  $\pm 33.3\%$  for small enterprises, house prosperity, other commerce and transport, etc. For the overall estimates, the margin of error is worked out at  $\pm 10\%$ . The quality and coverage of basic data have since improved and in August 1967 the Central Statistical Organization (C.S.O.), released its brochure on revised series of national product. The improvements incorporated in the revised series relate to the industrial classification of the national product, presentation of estimates separately for gross and net product, incorporation of 1961 Census data and the results of the various surveys undertaken by the C.S.O. and other agencies. The estimates at constant (i.e. 1960-61) prices have also been improved by building up more appropriate indicators and deflators for measuring gross/net product in various industries.

to rise by about one-third during this period, *real* per capital income in 1980-81 would be 53 per cent higher than its level in 1968-69.

The economic growth registered in the last eighteen years is also reflected in the changes in the industrial origin of the national output as well as in the shift in the occupational pattern. Some light on this crucial question is thrown by the analysis of the sectoral rates of growth undertaken in the following table:

TABLE IV

\*Conventional Estimates of Net National Product (at 1948-49 prices).

It will be seen from the Table above that whereas income originating in the agricultural sector increased over the period of 17 years at a compound rate of 2.8 per cent per year, income originating in the non-agricultural sectors (mining, manufactures, small enterprises, commercial transport, communication and other services) increased at a rate of 4.7 per cent. During this period, the share of the agricultural sector in the total domestic product declined from 49 per cent to 42 per cent and that of non-agricultural sector rose from 51 per cent to 60 per cent. It may, however, be mentioned that in 1967-68, the industrial sector had not as yet fully recovered from the impact of the recession. Nonetheless, it is relevant to note that the net output of mining and manufacturing establishment is estimated to have risen at a compound rate of 5.6 per cent per annum between 1960-61 and 1968-69, and in terms of the Fourth Plan, this is expected to expand at an overall rate of around 9 per cent during the Fourth Plan period. This order of expansion has been considered consistent with the projected annual growth rate of 5.5 per cent in

national income and 5 per cent in the net output of the agricultural sector. The sectoral composition of the net domestic product as projected in the Fourth Plan is as follows:

TABLE V

Sectoral Composition of Net Domestic Product: 1968-69 to 1980-81  
(Rs. 100 crores at 1968-69 prices)

| No. | Sector                                 | 1968-69 | 1973-74 | 1978-79 | 1980-81 | <i>Index of growth<br/>1980-81<br/>over 1968-69</i> |
|-----|----------------------------------------|---------|---------|---------|---------|-----------------------------------------------------|
| 1.  | Agriculture and allied activities.     | 148.6   | 189.5   | 234     | 254     | 171                                                 |
| 5.  | Mining, manufacturing and construction | 55      | 80.6    | 126     | 150     | 273                                                 |
| 3.  | Others                                 | 87.1    | 113     | 157     | 178     | 204                                                 |
| 4.  | Net domestic product                   | 290.7   | 383.1   | 517     | 582     | 280                                                 |

Another indicator of the structural change in the economy is the shift in the pattern of employment. The 1961 Census divides the total population into workers and non-workers. Workers include those deriving their earnings from productive occupations followed either as a principal or a subsidiary means of livelihood, irrespective of the level of earnings, provided they are employed in seasonal work for more than one hour a day throughout the greater part of the working season or in regular work during any of the fifteen days preceding the day of enumeration. A person who was working but was absent from his work during the fifteen days preceding the day of enumeration due to illness or other causes was a worker. A person who was offered work but had not actually joined was treated as a non-worker. Supervisory staff, apprentices (paid or unpaid) and social or political workers are treated as workers while beggars, pensioners, ex-royalty, rent, or dividend receivers not participating in any productive profession, business or commerce, are excluded. The definition is, therefore, more comprehensive and include self-employed as well as earning dependents having a principal or subsidiary means of livelihood. The workers employed have been classified by occupational categories both for 1961 and for earlier censuses to ensure comparability on the basis of the new definition. Some idea of the sectoral growth in number of workers employed and the consequential shift in employment pattern is given in Table VI.

The Table indicates that the annual rate of growth in the number of workers employed has been faster in industry, construction and transport. These are, broadly speaking, the very sectors whose net output also showed a relatively faster rate of annual growth over about the same period. For subsequent years, the available information relates to the

\*Employment Reviews, 1960-61 and 1968-69 -- Directorate General of Employment and Training.

The analysis of the trends in output and employment attempted in the preceding paragraph does not, however, tell the whole story of structural transformation initiated in the economy since the commencement of economic planning. It does not bring out the changes within each of the major sectors, some of which are highly relevant for a faster growth

of the economy in future years. It also throws no light on the factors promoting or retarding growth that have been operative during the period in the various sectors. To make up this deficiency, the growth of the two major sectors — agriculture and industry — has been analysed in greater detail on the basis of such supplementary data as are available.

The following Table sets forth the analysis for agriculture proper covering production of both foodgrains and non-food crops:

TABLE No. VIII

|                  | <i>Index Numbers 1949-50 = 100</i> |         |         |         | <i>Compound rate of growth per cent per annum</i> |         |         |         |
|------------------|------------------------------------|---------|---------|---------|---------------------------------------------------|---------|---------|---------|
|                  | 1950-51                            | 1955-56 | 1961-62 | 1968-69 | 1951-56                                           | 1956-62 | 1962-69 | 1951-69 |
| <b>All Crops</b> |                                    |         |         |         |                                                   |         |         |         |
| Area             | 99.9                               | 115.0   | 123.8   | 125.7   | 2.8                                               | 1.3     | 0.2     | 1.3     |
| Production       | 95.6                               | 116.8   | 144.8   | 158.7   | 4.1                                               | 3.6     | 1.4     | 2.9     |
| Productivity     | 95.7                               | 101.6   | 117.0   | 126.3   | 1.2                                               | 2.3     | 1.2     | 1.6     |

It will be seen that agricultural production (all crops) increased at a compound rate of 4.1 per cent per annum during 1951-56, of 3.6 per cent during 1956-62 and 1.4 per cent during 1962-69. Taking the entire period of eighteen years, agricultural production is estimated to have grown at an annual compound rate of 2.9 per cent. Both increase in area under cultivation and improvement in productivity of agriculture contributed to the increase in production. While the increase in the area under cultivation was the dominating factor during the First Plan period, when bulk of the extension of farming to new lands was accomplished leaving scope for only marginal addition during the remaining years, the increased production during the period 1956-69 resulted from improved productivity and more intensive farming. With limited scope for extensive farming in future years, it follows that improvement in the rate of growth of agricultural production can be brought about principally by resort to more intensive farming. The strategy of production as indicated in the Fourth Plan, therefore, places very little reliance on bringing additional land under cultivation; the main emphasis is on intensive agriculture, consisting of extension of high yielding variety programmes and multiple cropping, continued expansion of irrigation facilities, improvement in the utilization of existing potential and intensive efforts in raising the productivity of commercial crops and enlargement in the facilities for inputs, credit and marketing.

Industrial production increased during the period 1951-69 at a compound rate of 6.4 per cent per annum. The general index of industrial production (1960=100) rose from 56.1 in 1951 to 172.4 in 1969. A special feature of industrial development, particularly since the beginning

of the Second Plan has been the emphasis on the development of steel, aluminium, engineering, chemical and petroleum products and on the growth of power and transport. A fairly good idea of the industrial diversification which has taken place can be had from the following data on the growth of certain selected industries.

TABLE IX

|                                           | 1950-51 | 1960-61 | 1964-65 | 1965-66 | 1968-69 |

\*Relates to calendar year.

The progress of industrialization during this period has led to a gradual transformation of the industrial structure. The weight of the consumer goods industries as determined by their percentage contribution to net value added by all industries has been steadily reduced while that of producer goods industries correspondingly increased. This trend is brought out by the Table below:—

TABLE X  
Contribution to Net Value Added

|                    | (Percentages) |         |         |         |
|--------------------|---------------|---------|---------|---------|

| Consumer goods     | 67.9          | 45.7    | 36.5    | 34.0    |
| Intermediate goods | 23.3          | 37.3    | 41.4    | 43.3    |
| Machinery          | 8.0           | 16.3    | 21.4    | 22.0    |
| Others             | 0.8           | 0.7     | 0.7     | 0.7     |
| Total              | 100.0         | 100.0   | 100.0   | 100.0   |

## II. Net Capital Formation

The foregoing analysis points to the urgency of a progressive step-up in the allocation of real resources for furthering production. If area under improved seeds is to be progressively extended to raise the rate of growth of agricultural output, it is imperative to set apart an increasing proportion of the output of farms using improved seeds for seed purposes. There will also be the need for building up at a corresponding pace seed storage and distribution facility. The storage facility has also to be built for stockpiling of foodgrains. Similarly, the use of fertilizers per hectare can be stepped up only if the availability of fertilizers improves *pari passu*. This entails larger allocation of real resources to expand the capacity of domestic production, transport and storage of the various types of fertilizers. The building up of irrigation potential and its fuller utilization also calls for an extended scale of investment in construction of irrigation works, canals, and distribution channels. Likewise, speedy and diversified industrial development involves an accelerated rate of investment to create additional capacity for production and transport. In short, a progressive stepping up of the rate of investment in the economy is a precondition for its more rapid growth. This is possible only if the real resources required for an accelerated rise in the rate of investment are forthcoming on an adequate scale, whether from domestic sources or from the rest of the world. What light do recent trends in net investment and savings throw on this problem?

Till recently, the available data on net capital formation were rather scrappy. The non-availability of data on saving and investments have long stood in the way of preparation of a comprehensive system of national accounts. The earliest attempt was made in the First Five Year Plan, which estimated net investment in 1948-49 prices to be Rs. 450 crores in 1950-51. This formed about 5 per cent of the national income for the year estimated at Rs. 9,000 crores.\* The Taxation Enquiry Commission estimated (in Volume I of its report) net investment at current prices for 1950-51 and 1953-54. The magnitudes were Rs. 555

---

\* *First Five Year Plan*, p. 108.

\*\* *Taxation Enquiry Commission Report*, New Delhi 1955 Vol. I, p. 138.

\*\*\* *Second Five Year Plan*, pp. 3 & 11

This was subsequently published in *Papers on National Income and Allied Topics* ed. by V. K. R. V. Rao, S. R. Sen and others, Bombay, 1960, pp. 122-34. The method followed is broadly the same as in the paper by M. Mukherjee and A. K. Ghosh estimating capital formation for 1948-49 (vide the *Pattern of Income and Expenditure in the Indian Union: A Tentative Study*, subsequently published in the *Bulletin of the International Statistical Institute*, December 1961) and in the paper on "Capital Formation in the Indian Union jointly prepared by the C.S.O. and the Economic Division of the Ministry of Finance published in *Papers relating to the formation of the Second Five Year Plan*, October, 1955. *Ibid.*, p. 121.

crores and Rs. 730 crores respectively.\*\* The Second Five Year Plan estimated net capital formation (at 1952-53 prices) at Rs. 790 crores for 1955-56. This formed 7.3 per cent of national income (at 1952-53 prices) and was expected to be raised to 10.7 per cent by the end of the Second Plan.\*\*\*

In a paper submitted to the first session of the Indian Conference on Research in National Income, Baldev Kumar of the Central Statistical Organization presented a 7-year series-estimates covering 1948-49 to 1954-55 for domestic fixed capital formation at current as well as 1948-49 prices. The series give sector-wise as well as overall estimates of fixed capital formation. In another paper read at the same conference, Honavar, Ghosh, Avadhani and Trikha of the Ministry of Finance presented totals of capital formation in the Indian Union for the years 1949-50 to 1954-55. These magnitudes were worked out at current prices by adding domestic savings to official donations and net borrowings from abroad as worked out from the Balance of Payments statistics. These efforts are significant more for the exploration of the techniques of estimation and availability of basic statistics that could possibly be used for calculating net investment over a time-period than for the magnitudes indicated. Yet another attempt at estimation of net investment was made by the Statistics and Economics Departments of the Reserve Bank in a paper submitted to the Working Group on Resources for the Third Five Year Plan in July, 1959. These estimates had a wider coverage and were based on better data that had since become available, for example, from the balance sheet analysis of the public and private limited manufacturing companies conducted by the Reserve Bank and the Rural Credit Survey Reports for 1951-52 and 1956-57.\*

The results of all the efforts at estimation of net capital formation cited above\*\* were available when the Third Five Year Plan was being formulated.

Nonetheless, the available data suffered from the absence of a continuous series of comparable estimates of net capital formation at constant prices for the entire period. Therefore, what can be described as notable developments in this field were the three series estimates of capital formation as brought out by (a) the Reserve Bank of India (R.B.I.); (b) National Council of Applied Economic Research (N.C.A.E.R.); and (c) Central Statistical Organization (C.S.O.). The first two were primarily concerned

\*The follow up Survey.

\*\*Among works of individuals not cited above reference may be made to the following:

with the estimation of domestic savings and the estimates of net investment presented by them were, therefore, either incidental to or a step towards this primary task. In March 1960, the Reserve Bank published<sup>1</sup> its series of estimated domestic savings for 1950-51 to 1957-58 at current as well as 1948-49 prices which included, as a necessary constituent, estimates of net physical asset formation by households in the form of farm and non-farm investment in agriculture, urban and rural housing, as also increases in fixed assets and inventory by non-corporate industry. This series of domestic saving was refined and extended and republished in August 1961<sup>2</sup> and again in March 1965<sup>3</sup> together with a series of estimated net investment in the economy as a whole for the period 1950-51 to 1962-63.

This series gave estimates at current as well as 1948-49 prices. Total investment was measured by adding to the estimates of domestic savings for each year the amount of net capital inflow from abroad. The latter was arrived at by adjusting current account deficits in the balance of payments for official donations, retained earnings of foreign branches and subsidiaries, unpaid imports and the approximate amount of gold smuggled into the country. The National Council of Applied Economic Research published<sup>4</sup> in April 1961 its series — estimates of gross and net domestic investment at current as well as 1952-53 prices for the period 1948-49 to 1957-58.<sup>5</sup> These attempted to provide the base from which the estimated inflow of capital from abroad could be deducted to arrive at the rate of net domestic savings as a residual item. The estimates of investment were made separately for Government, corporate and individuals' sectors. The Central Statistical Organization estimated only gross capital formation for the entire economy for the period 1948-49 to 1960-61 both at current and 1958-58 prices.<sup>6</sup>

These estimates were based on the commodity flow approach<sup>7</sup>, and no

| 1952-53 | 1,294                                                   | 377                                                     | 635                                                 | 742             |
| 1953-54 | 1,344                                                   | 538                                                     | 663                                                 | 769             |
| 1954-55 | 1,531                                                   | 867                                                     | 996                                                 | 1,021           |
| 1955-56 | 1,832                                                   | 1,086                                                   | 1,275                                               | 1,233           |
| 1956-57 | 2,118                                                   | 1,415                                                   | 1,425                                               | 1,428           |
| 1957-58 | 2,259                                                   | 1,230                                                   | 1,486                                               | 1,677           |
| 1958-59 | 2,153                                                   | 1,230                                                   | 1,417                                               | 1,318           |
| 1959-60 | 2,248                                                   | 1,246                                                   | 1,367                                               | 1,496           |
| 1960-61 | 2,475                                                   | 1,683                                                   | 1,715                                               | 1,774           |

All the three series show a generally rising trend. The level estimate for 1960-61 is 2.0 times higher than in 1950-51 in the C.S.O. series, 3.4 times in the R.B.I. series and 2.6 times in the N.C.A.E.R. series. The S.C.O. series, however, start at a considerably higher level and remain so throughout for two reasons first, these estimates are for gross and not net capital formation and do not allow for capital consumption. Secondly, they are at 1958-59 prices, which were considerably higher than 1946-49 prices on which the N.C.A.E.R. or R.B.I. estimates are respectively based. The N.C.A.E.R. estimates for net investment are also consistently higher than the R.B.I. estimates. This is partly due to certain adjustments made, for example, for changes in inventory valuation. However, the differences between the R.B.I. estimates and N.C.A.E.R. estimates have been narrowed down after certain refinements and both the series have tended to move quite close to the net estimates of capital formation by C.S.O. given in the Appendix to its paper.

The authors of these series themselves admit the limitations of the estimates emanating from restricted and inadequate basis, and the somewhat arbitrary assumptions underlying the estimational procedure adopted for certain components. Till such time as more refined and reliable estimates of net capital formation at constant prices are available for different sectors and by forms of investment in the various lines of activity in each sector, one cannot go beyond making a general statement that the step-up in the rate of real income growth in the fifties was

accompanied by a substantial step-up in the rate of net investment in the economy, and the latter must have contributed to the former in a significant manner.

Some interesting light on this aspect is, however, obtained when we turn our attention to some alternative sources of data. Three attempts have been made in recent years to estimate the stock of reproducible tangible wealth in India, which broadly corresponds to the stock of capital employed in economic activity. The first estimate was made by Uma Datta and Vinod Prakash<sup>1</sup> for the year 1949-50, the second by Mukherjee and Sastry<sup>2</sup> again for 1949-50, and the third by the Department of Statistics<sup>3</sup> of the Reserve Bank of India for the year 1960-61. All the three estimates are at current prices and give overall estimates as well as the sectoral break-downs. The Reserve Bank estimates for 1960-61 follow closely the estimates of Mukherjee and Sastry and are made on comparable lines. They are also presented side by side as estimates for the two points of time, 1949-50 and 1960-61. These estimates have been reviewed by Uma Datta in a paper<sup>4</sup> read at the Fourth Indian Conference on Research in National Income held in Bhopal in November 1963. This latter paper converts the 1949-50 estimates of Mukherjee and Sastry to 1960-61 price base, in order to study the change in the stock of reproducible tangible wealth in real terms between 1949-50 and 1960-61. The sectoral break-downs in the original estimates have also been rearranged in conformity with the grouping in the sectoral estimates of net domestic output available in National Income Estimates. This has been done to work out the capital-output ratios for the various sectors and the economy as a whole.

The Table XII constructed on the basis of the data in the paper by Uma Datta brings out some interesting aspects of economic growth since 1949-50:

Although the estimates of reproducible tangible wealth like those of net capital formation cited in the preceding paragraphs are also weak in parts and do not warrant reading too much into them, the broad trends indicated by them are worth noting. The data set forth in the Table XII shows that reproducible tangible wealth has grown over the period 1950-61 in real terms at a compound rate of a little over 4 per cent per annum, while number of workers employed has increased at a compound

| Reproducible tangible wealth (Rs. crores) | 20,622  | 21,224  | 32,164  | 4.1                                                 | 4.2     |
| Net domestic product (Rs. crores)         | 9,834   | 9,867   | 14,210  | 3.4                                                 | 3.7     |
| Capital output ratio                      | 2.10    | 2.15    | 2.26    | —                                                   | —       |
| Workers (million)                         | N.A.    | 139.5*  | 188.4*  | —                                                   | 3.0     |
| R.T.W. per worker (Rupees)                | —       | 1,521   | 1,707   | —                                                   | 1.2     |
| Output per worker                         | —       | 707     | 754     | —                                                   | 0.7     |

\*Refers to 1951 and 1961 Census years.

Source: 1961 Census.

rate of 3 per cent per annum. As a result, capital per worker has gone up from Rs. 1,521 in 1950-51 to Rs. 1,707 in 1960-61, registering a growth at the compound rate of over 1 per cent per annum. This slow improvement in capital per worker must have contributed to the growth of net domestic product over the same period, which occurred at a compound rate of 3.7 per cent per annum. This is reflected in net domestic product per worker going up in real terms from Rs. 707 in 1950-51 to Rs. 754 in 1960-61. Even so, the capital intensity in the economy has only slightly improved. Capital-output ratio rose from 2.10 in 1949-50 to 2.15 in 1950-51 and 2.26 in 1960-61. This may, in part, explain the slow rate of growth of output during the period as also suggest the need for a still faster rate of growth in reproducible tangible wealth in future years, if capital intensity and, therefore, productivity of the economy, is to improve faster, and output per worker is to register a sharper increase from 0.7 per cent per annum achieved during the period (1950-61).

Another interesting feature is brought out by the XIII Table:

The shift in the sectoral shares of net output over the period broadly conforms to the shift in the sectoral shares of the stock of reproducible tangible wealth, the only exception being Railways and Services. The share of railways in net output has improved but its share in the stock of reproducible tangible wealth has gone down. This is quite likely since the period has been one of heavy expenditure on renewal and replacements of railways' fixed assets, and these normally contain elements of improved quality which go to enhance productivity. Further, a more effective utilization and increased turn over of the rolling stock is reported to have taken place, which must have also added to railways' productivity.

TABLE XIII

**Sectoral Distribution of Reproducible Tangible Wealth and Net Output**  
(At 1960-61 Prices)

(Per cent)

|                     | <i>Reproducible Tangible Wealth</i> |         | <i>Net Output</i> |         |
|---------------------|-------------------------------------|---------|-------------------|---------|
|                     | 1949-50*                            | 1960-61 | 1949-50           | 1960-61 |
| Agriculture         | 29.4                                | 28.2    | 51.8              | 48.6    |
| Mining              | 0.6                                 | 0.6     | 0.9               | 1.1     |
| Large enterprises   | 10.2                                | 16.1    | 6.9               | 9.9     |
| Small enterprises   | 4.6                                 | 3.7     | 10.3              | 7.9     |
| Railways            | 9.6                                 | 8.6     | 2.2               | 2.5     |
| Communications      | 0.6                                 | 0.6     | 0.3               | 0.4     |
| Trade and transport | 17.1                                | 17.3    | 13.2              | 13.5    |
| Services            | 27.9                                | 24.9    | 14.4              | 16.7    |
| Total:              | 100.0                               | 100.0   | 100.0             | 100.0   |

\*Both were exceptionally good year for agriculture.

Part of the increase in output may also have come from improvement in the efficiency of workers employed quite independently of the increase in capital per worker. As for the services sector, the improvement in its share of net domestic product despite decline in its share of the stock of reproducible tangible wealth is quite legitimate to expect, since it includes net output of Government administration the expansion of which reflects mainly an increase in the number of employees. The shift in sectoral distribution brings out pointedly the impact of the Plans in initiating a structural transformation of the economy; the sharp rise in the share of large enterprises in both net output and the stock of reproducible tangible wealth provides the evidence.

In the preceding paragraphs, attention has been concentrated on data throwing light on developments in the fifties. In recent years, significant strides have been made in improving on the data on saving and capital formation as in the construction of flow-of-fund accounts. The C.S.O. published in 1963 the Report of its Working Group on the construction of flow-of-fund accounts of the Indian economy for 1957-58. Based on the flow-of-fund approach, K. C. Sharma's paper on "Financing of capital formation in the public sector, 1951-52 to 1960-61" read at the Fourth Annual Conference on Research in National Income provided a detailed analysis of the public sector investment and its financing pattern. The construction of flow-of-funds for the various sectors of the Indian economy has since been further refined and its scope extended by the Reserve Bank of India as revealed by the various studies published in its monthly bulletins.

The R.B.I. is also continuously engaged in improving its series on saving and investment. The latest development in the field is the C.S.O.'s

publication in 1969, of its estimates of saving and capital formation in India for 1960-61 to 1965-66. In its original monograph published in 1962, the C.S.O. had derived its saving estimates in an indirect fashion by deducting from its estimates of gross capital formation, the corresponding figures of net capital inflow from abroad. Their estimates of saving, now released, have been built up directly for three sectors (*e.g.* public, corporate and household) and have been added up to get estimates for the economy as a whole. As regards the C.S.O.'s estimates of capital formation, they are based mainly on the expenditure-flow approach. The relevant magnitudes which emerge are as follows:

TABLE XIV  
Estimates of Capital Formation

| <i>Year</i> | <i>At current prices</i> | <i>At 1960-61 prices</i> |
|-------------|--------------------------|--------------------------|
| 1960-61     | 1,665                    | 1,665                    |
| 1961-62     | 1,789                    | 1,624                    |
| 1962-63     | 1,920                    | 1,794                    |
| 1963-64     | 2,353                    | 2,120                    |
| 1964-65     | 2,681                    | 2,286                    |
| 1965-66     | 3,056                    | 2,442                    |

Mention may also be made of some other related developments in this field. In February 1957, the Ministry of Finance issued an economic classification of the Central Government Budget for 1957-58. This brought out the magnitudes of net investment in construction and machinery and equipment directly undertaken by the Central Government as also the financial assistance given to other sectors of the economy for capital formation. This work was extended to the transactions of the State Governments and non-departmental undertakings of the Central Government for the years 1951-52 to 1960-61. The economic classification of the transactions of these entities together with that of the Central Government since 1951-52 had enabled the construction of a time-series of net investment by the Central and State Governments together for the period 1951-52 to 1960-61.\* The scope of work has since been extended. The brochure on economic classification of the Central Government issued in 1967 contained a review of developments in the first three Five-Year Plans and also initiated an economic-cum-functional classification which is now brought out every year. Some of the State Governments have also started bringing out an economic classification of their respective budgets. The transactions of the public sector are also presented in terms of national income categories in the C.S.O.'s Annual White Paper on National Income.

\*Reference may be made in this connection to A.V.N. Iyengar's paper — "Saving and investment of the public sector 1951-52 to 1960-61" read at the Fourth Annual Conference on Research in National Income.

Fairly satisfactory estimates are available for capital formation in the public sector. The following Table presents the data on net capital formation worked out by the Ministry of Finance on the basis of the economic classification of the transactions of public authorities.

TABLE No. XV  
Net Capital Formation by the Public Authorities

|                                                                                              | (Rs. crores)<br>(At current prices) |         |         |

| (a) Industry                                                                                 | 2                                   | 10      | 150     |
| (of which, steel industry)                                                                   | (—)                                 | (3)     | (112)   |
| (b) Mining                                                                                   | —                                   | —       | 32      |
| (c) Transport                                                                                | 1                                   | 4       | 8       |
| (d) Trading and other undertakings                                                           | —                                   | 3       | 5       |
| 3. State Government Administration and departmental industrial and commercial undertakings   | 150                                 | 253     | 346     |
| Total                                                                                        | 217                                 | 373     | 754     |

The Table brings out the sharp rise in the level of net capital formation during the period covered by the first two Plans. The level of total investment by public authorities in 1960-61 was twice the level in 1955-56 and three and a half times the level in 1951-52. The bulk of the net investment by Central Government administration and departmental undertakings was in railways, while the bulk of net investment by non-departmental Central Government undertakings was in basic industry (steel, fertilizers, chemicals and electricals) and by State Government Administration and departmental undertakings in irrigation works, power projects, roads and road transport schemes.

The break-down of net investment by form of investment is shown in the following Table:

TABLE No. XVI  
Net Investment by Form of Investment

|                            | (Rs. crores)<br>(At current prices) |         |         |
|----------------------------|-------------------------------------|---------|---------|
|                            | 1951-52                             | 1955-56 | 1960-61 |
| 1. Construction            | 158                                 | 342     | 503     |
| 2. Machinery and equipment | 14                                  | 62      | 186     |
| 3. Inventory accumulation  | 45                                  | (—)31   | 65      |
| Total                      | 217                                 | 373     | 754     |

The sharp swing in favour of investment in machinery and equipment during the Second Plan reflects the higher priority given to industry in public sector investment.

Although the figures given above are in current prices, the rise in public investment is so large that even if allowance were made for the price rise during the period, a marked step-up in public investment would still be indicated. This is corroborated by the following Table giving net investment by form of investment at 1960-61 prices:

TABLE No XVII  
Net Investment by Form of Investment  
(Rs. crores) (At 1960-61 prices)

|                            | 1951-52 | 1955-56 | 1960-61 |
|----------------------------|---------|---------|---------|
| 1. Construction            | 198     | 413     | 503     |
| 2. Machinery and equipment | 17      | 71      | 186     |
| 3. Inventory accumulation  | 48      | —42     | 65      |
| Total:                     | 263     | 442     | 754     |

Note: The deflators used are based on:

- (1) Price Index for Construction (*vide* R.B.I. Bulletin, January 1963, p. 19).
- (2) Price Index for machinery and transport equipment (*vide* R.B.I. Bulletin, January 1963, p. 19).
- (3) Economic Adviser's Wholesale Price Index.

Public investment promotes income growth both directly and indirectly. Wage and salary component of investment outlays on public construction adds to the income stream directly, while outlays on domestically produced material inputs stimulate output increases in the supplying sectors by encouraging utilization of excess capacity, if any, and installation of additional capacity. Public investment on social and economic overheads generates external economies, and removes bottlenecks to expansion in productive activities. These, in turn, stimulate further investment and output increases in the rest of the economy. Investment creating additional capacity in public enterprises brings about increases in their net output after it goes into production. The increase in output may, however, not occur in the same period in which investment is made. The output increases in such undertakings also induce output increases in other sectors by creating additional demand. All these aspects of growth promotion by public investment cannot be reduced to a common measure, and the growth of net output of public authorities during any period of public investment is but limited aspect of income growth stimulated by it. However, even in this limited sense the period under consideration registered a substantial increase in income generated by public investment. The relevant data are set forth in the Table XVIII:

TABLE XVIII

(Rs. crores)  
(At current prices)

|                                                      | 1951-52    | 1955-56    | 1960-61    |
|------------------------------------------------------|------------|------------|------------|
| <b>Construction</b>                                  | <b>59</b>  | <b>122</b> | <b>196</b> |
| (i) Central Government                               | 17         | 34         | 89         |
| (ii) State Governments                               | 42         | 88         | 107        |
| Net output of industrial and commercial undertakings | 255        | 311        | 436        |
| (i) Central Government                               | 211        | 250        | 347        |
| (ii) State Governments                               | 44         | 61         | 89         |
| <b>Total</b>                                         | <b>314</b> | <b>433</b> | <b>632</b> |

Note: (a) Central Government includes administration and departmental and non-departmental commercial undertakings.

(b) State Governments include administration and departmental commercial undertakings.

For the sixties, a combined analysis based on the operations of the Central and State Governments is not available. However, having regard to the fact that the total provision for capital formation out of the budgetary resources of the Central Government accounts for the bulk of capital formation undertaken in the public sector, an analysis of data based on the economic classification of the Central Government budget appears meaningful.

TABLE XIX

(Rs. crores)

|                                                                                                   | 1960-61    | 1965-66      | 1966-67      | 1967-68      | 1968-69      | 1969-70<br>(R.E.) | 1970-71<br>(R.E.) |
|---------------------------------------------------------------------------------------------------|------------|--------------|--------------|--------------|--------------|-------------------|-------------------|
| <b>Gross capital formation</b>                                                                    | <b>865</b> | <b>1,806</b> | <b>1,793</b> | <b>1,675</b> | <b>1,660</b> | <b>1,770</b>      | <b>2,005</b>      |
| (i) Direct                                                                                        | 311        | 520          | 500          | 467          | 276          | 507               | 615               |
| (ii) Indirect (i.e. through assistance to States, Union Territories and Public Undertakings etc.) | 554        | 1,286        | 1,293        | 1,206        | 1,384        | 1,263             | 1,390             |

The second decade of planning also provides substantial evidence of brisk investment activity. For 1970-71, the total capital formation financed out of the Central Government budget shows an increase of 120 per cent over the level of capital formation in 1960-61. These estimates are, of course, at current prices. However, the step-up is so large that even after allowing for the price factor, a substantial increase in the level of the investment activity should emerge.

The marked step-up in the investment outlays provided in the Fourth Five Year Plan further indicates the order of effort visualized in order to

quicken the pace of economic progress. The Table below gives the comparable figures for the successive Plans:

TABLE XX

(Rs. crores)

|                          | <i>I Plan</i> | <i>II Plan</i> | <i>III Plan</i> | <i>IV Plan</i> |
|--------------------------|---------------|----------------|-----------------|----------------|
| Public sector investment | 1,560         | 3,650          | 6,300           | 13,655         |
| Private sector           | 1,800         | 3,100          | 4,100           | 8,980          |
| Total:                   | 3,360         | 6,750          | 10,400          | 22,635         |

It may be noted that whereas the investment in the Third Plan was a little more than the total investment undertaken in the preceding two Plans, the provision in the Fourth Plan is a little more than the sum total of investment undertaken in the first three Plans taken together. As a result of the investment activity as postulated in the Fourth Plan document, the rate of investment was expected to be stepped up from 11.3 per cent of national income in 1968-69 to 14.5 per cent in 1973-74. The incremental capital-output ratio works out to 2.0 for the Fourth Plan as compared with 2.4 for the first three Plan periods. Consistent with the strategy of self-reliant growth, the proportion of inflow of foreign aid to national income will come down from 2.5 per cent to 1.3 per cent and the rate of domestic saving is expected to rise from 8.8 per cent in 1968-69 to 13.2 per cent in 1973-74. This means diverting to saving 28 per cent of increase in national income during the Fourth Plan period.

### III. Domestic Savings and Net Inflow of Foreign Capital

The setting apart of an increasing proportion of domestic resources for investment involves a progressive step-up in the rate of domestic savings. Under conditions of rising national income, it implies a corresponding restraint on increases in domestic consumption. This is the cost borne by the community for speedily building up a prosperous economy, which will provide for greater rise in consumption standards in future years and thereby compensate the community for the consumption sacrificed during the construction phase. The immediate cost to the community, however, can be kept down to the extent it is possible to draw upon real resources of the rest of the world by augmenting net capital inflow into the country. This implies accelerated mobilization of others' savings for stepping up domestic investment and to that extent obviating the need for the community to forgo increase in consumption. This requires an analysis of what has been the relative contribution of domestic savings and net capital inflow in attaining the step-up in the rate of domestic investment since the commencement of planning and what relative role could be assigned to them for providing real resources required for accelerating the rate of investment in future years?

The analysis of the relative role of domestic savings and net capital inflow in domestic capital formation in the recent past requires a series of the estimates for each at constant prices. The first exploratory attempt to build estimates for domestic savings was made by the Taxation Enquiry Commission for the year 1953-54<sup>1</sup>. This was followed up by the officials of the Union Ministry of Finance who attempted a more detailed estimation and constructed a series for the years 1949-50 to 1954-55<sup>2</sup>. Both the series gave estimates at only current prices and were based on institutional data available in published sources. The successive Five Year Plans, however, indicate the rate of domestic savings attained in the base year and the target to be reached in the last year of each Plan. The First Five Year Plan<sup>3</sup> placed its estimate of domestic savings at 1948-49 prices around Rs. 450 crores for 1950-51. This formed about 5 per cent of the estimated national income and was to be raised to Rs. 675 crores or around 7 per cent of national income by the end of the Plan. The Second Five Year Plan placed the rate of domestic savings attained in 1955-56 at Rs. 731 crores or 7.0 per cent of the national income, both estimated at 1952-53 prices. The target to be attained in 1960-61 was fixed at 9.7 per cent of national income<sup>4</sup>. The Third Plan estimated domestic savings to have reached 8.5 per cent of national income in 1960-61; this was to be raised to 11.5 per cent by the end of the Plan period<sup>5</sup>. More systematic attempts at savings estimation have been made since the publication of the Third Five Year Plan by (a) the Reserve Bank of India<sup>6</sup> and (b) the National Council of Applied Economic Research<sup>7</sup>. Both R.B.I. and N.C.A.E.R. have made direct estimates of domestic savings on the basis of institutional data following the balance sheet and income-expenditure approach for different sectors. Their sector-wise as well as overall estimates are presented at current prices as well as constant prices. For the constant price series, both R.B.I. and N.C.A.E.R. estimates use 1948-49 prices. Both series of direct estimates give estimates for public sector, private corporate sector and individuals or household sector separately, and for the latter a breakdown by forms of savings is also provided. In addition to direct estimates, N.C.A.E.R. has also given a series of indirect estimates derived by deducting from total net investment the amount of net disinvestment

(Rs. crores)

|         | R.B.I.            |                   | N.C.A.E.R.        |                   |
|---------|-------------------|-------------------|-------------------|-------------------|
|         | At current prices | At 1948-49 prices | At current prices | At 1948-49 prices |
| 1950-51 | 541.9             | 503.2             | 733.1             | 674.4             |
| 1951-52 | 529.4             | 483.2             | 668.7             | 608.5             |
| 1952-53 | 408.3             | 393.3             | 670.3             | 643.4             |
| 1953-54 | 565.0             | 540.9             | 700.0             | 665.0             |
| 1954-55 | 764.2             | 817.4             | 895.6             | 958.3             |
| 1955-56 | 970.5             | 1,019.2           | 1,144.1           | 1,201.3           |
| 1956-57 | 1,076.4           | 1,047.2           | 1,093.3           | 1,060.5           |
| 1957-58 | 797.8             | 762.7             | 1,058.7           | 1,016.3           |
| 1958-59 | 931.4             | 861.1             | 1,140.4           | 1,049.2           |
| 1959-60 | 1,102.0           | 1,009.2           | 1,247.3           | 1,135.1           |
| 1960-61 | 1,371.9           | 1,235.2           | 1,408.4           | 1,267.6           |

Both the series of estimates (R.B.I. and N.C.A.E.R.) suffered from weakness in parts; nevertheless, both showed about the same trends, if the level differences emerging from adjustments for changes in inventory valuation, and differences in assumptions, method of estimation and coverage of certain components like inventory accumulation and rural and urban constructions were ignored.

Both the R.B.I. and N.C.A.E.R. have attempted to provide a picture of the financing of net investment by giving estimates of net capital inflow from abroad for the corresponding years. These estimates were based on balance of payments statistics adjusted for items like retained profits

TABL XXII

| 1958-59 | +399.3            | +369.2            | +399.30           | +367.36           |
| 1959-60 | +258.3            | +236.6            | +266.80           | +242.79           |
| 1960-61 | +497.3            | +447.7            | +497.05           | +447.35           |

\*C.S.O. has also estimated gross domestic savings for the period 1948-49 to 1959-60 and net domestic savings for 1955-56 to 1959-60. But both are at current prices only and a large part pertaining to the savings of private non-corporate sector derived as a residual by deduction from the estimates of gross capital formation, the savings of the public and private corporate sector estimated on the basis of income-expenditure accounts, C.S.O.; National Income Statistics — *Financing of Gross Capital Formation for 1948-49 to 1959-60*, New Delhi.

of foreign companies, unpaid imports etc., which do not figure in the payments data. Here too, the estimates were at current prices as well as constant (1948-49) prices. Since the method and basis of estimation is common except for some minor differences, there was again perfect conformity between the trends of the two series.

Except in 1951-52, the inflow of foreign capital was hardly significant during the First Plan period. In contrast, data show a marked dependence on this source of capital formation during the Second Plan; in terms of both these series, the net capital inflow from abroad accounted for about one-fourth of the total investment in 1960-61.

Mention has already been made of the C.S.O.'s estimates of savings and capital formation published in 1969—these cover the period 1960-61 to 1965-66. The following Table shows the relative rates of domestic and foreign saving in financing capital formation during the Third Plan period, as revealed by C.S.O. data.

TABLE XXIII  
Domestic and Foreign Saving

| <i>Year</i> | <i>Domestic saving proportion (in per cent) to national income</i> | <i>Foreign saving proportion (in per cent) to national income</i> |
|-------------|--------------------------------------------------------------------|-------------------------------------------------------------------|
| 1960-61     | 8.4                                                                | 3.4                                                               |
| 1961-62     | 9.1                                                                | 2.3                                                               |
| 1962-63     | 9.6                                                                | 2.9                                                               |
| 1963-64     | 11.1                                                               | 2.6                                                               |
| 1964-65     | 10.2                                                               | 2.9                                                               |
| 1965-66     | 12.1                                                               | 2.7                                                               |

(The C.S.O.'s estimate of domestic saving do not agree with those given in the Plan documents. The Planning Commission's estimate of domestic saving is 8% of national income for 1960-61 and 10.5% of national income for 1965-66.

What emerges out of all this is that while the rate of net domestic investment during the First Plan period was rendered possible by a corresponding step-up in the rate of net domestic savings, the rate of net domestic savings during the subsequent Plans has not been adequate to finance the rising levels of investment activity. During the first half of the Second Plan period, the inflow of resources from abroad was financed largely by liquidation of India's foreign exchange reserves. Thereafter, domestic savings have been supplemented essentially by external assistance. Consequently, the extended scale of real resources provided by the rest of the world through net capital inflow into the country has been an important factor underlying the acceleration of the rate of domestic investment during the planning era. This net capital inflow rose from 0.6 per cent of national income in 1956-56 to 3.4 per cent of national income in 1960-61; it stood at 2.7 per cent in 1965-66.

During the period of Annual Plans, there was a declaration in the rate of domestic saving; the rate of domestic saving, according to the Planning Commission, stood at 8 per cent of national income in 1967-68. The strategy in the Fourth Plan enjoins that concessional imports of food-grains will stop by 1971 and the dependence on net foreign aid by the end of the Fourth Plan will be brought down to about one-half of the 1968-69 level. The objective is to dispense with external assistance completely by 1980-81, and to attain it, the rate of domestic saving has to be stepped up from 8.8 per cent in 1968-69 to 13.2 per cent in 1973-74 and further to 18 per cent in 1980-81.

Effort has, therefore, to be made to accelerate the growth of both public and private savings. The following Table based on the magnitudes emerging from the economic classification of the Central Government Budget shows the growth of the Central Government saving during 1951-52 to 1970-71:

**[TABLE XXIV]**  
**Central Government Savings (net)**

(Rs. crores)

|                                                      | <i>First<br/>Plan<br/>1951-56</i> | <i>Second<br/>Plan<br/>1956-61</i> | <i>Third<br/>Plan<br/>1961-66</i> | <i>Annual<br/>Plans<br/>1966-69</i> | <i>1969-<br/>70<br/>(R.E.)</i> | <i>1970-<br/>71<br/>(R.E.)</i> |

| 1. <i>Savings of Government,<br/>Administration</i>  | 259                               | 236                                | 1,012                             | 298                                 | 81                             | 231                            |
| 2. <i>Savings of departmental<br/>undertakings</i>   | 77                                | —18                                | 353                               | 123                                 | 59                             | 111                            |
| (a) <i>Retained profits</i>                          | 121                               | 171                                | 297                               | 54                                  | 37                             | 87                             |
| (b) <i>Depreciation provision</i>                    | 171                               | 245                                | 435                               | 333                                 | 116                            | 124                            |
| <i>Less</i> (c) <i>Renewals and<br/>Replacements</i> | 215                               | 434                                | 379                               | 264                                 | 94                             | 100                            |
| <b>Total</b>                                         | <b>336</b>                        | <b>218</b>                         | <b>1,365</b>                      | <b>421</b>                          | <b>140</b>                     | <b>342</b>                     |

The above Table shows that the Central Government saving in the Third Plan was about six times the amount of saving generated during the Second Plan. The rate of saving declined in the period of Annual Plans, reflecting the sluggishness in the Government revenues and receipts of public undertakings and also the growth of such expenditures as provision for food subsidy and large disbursements on account of increases in dearness allowance.

As stated earlier, there has to be a sharp step-up in the rate of domestic saving if the rate of investment has to be raised and dependence on

external assistance reduced. The Table below shows the sector-wise break-up of domestic saving expected to take place in the next decade:

TABLE XXV  
Ratio of Net Domestic Savings to National Income by  
Sectors: 1968-69 to 1980-81\*

| Sector                 | 1968-69 | 1973-74 | 1980-81 |
|------------------------|---------|---------|---------|
| Household              | 6.4     | 7.6     | 8.4     |
| Corporation            | 1.0     | 1.1     | 1.4     |
| Public                 | 1.4     | 4.5     | 8.2     |
| Total Domestic Savings | 8.8     | 13.2    | 18.0    |

\*Fourth Five Year Plan 1973-74.

What emerges is the crucial role of public saving. While the saving of the household sector is to rise from 6.4 per cent in 1968-69 to 7.6 per cent in 1973-74 and further to 8.4 per cent in 1980-81, and that of corporate sector from 1.0 per cent to 1.1 per cent and further to 1.4 per cent during these respective years, the ratio of public saving to national income is expected to rise from 1.4 per cent in 1968-69 to 4.5 per cent in 1973-74 and further to 8.2 per cent in 1980-81. The projected order of increase in public saving signifies the effort that will be needed by the public authorities to mobilize additional resources. This throws a tremendous responsibility on the public sector and implies in terms of additional tax effort that the proportion of tax revenues to national income will have to be raised from about 14 per cent now to about 18.5 per cent by 1980-81.

## CONSUMPTION AND WELFARE

A good deal of information on household consumption expenditure was collected by comparable methods in the National Sample Survey (N.S.S.) in the form of 'rounds' of survey, year by year, for many years. The aggregate value of consumption per person\* of a household may be used as an approximate indicator of the level of living of the household. For any given round of the N.S.S., it is possible to arrange the sample households in ascending order of the aggregate value of the total per capita consumption expenditure per month\*\*; such ordering would correspond approximately to increasing levels of living. The sample households can then be divided into a suitable number of groups of equal size\*\*\* from the bottom. If, say, ten equal groups each of ten per cent (*i.e.*, ten decile groups) are used, then the bottom ten per cent would represent the poorest section of the people, and the top ten per cent the richest households. A comparison of the consumption in physical terms, or in money terms, of particular items, or of all items of goods or services, for the ten different decile groups would supply information about disparities in the level of living between the ten decile groups.

**Comparison Over Time:** Detailed information on the consumption of a number of goods and services has been tabulated for seven rounds of the National Sample Survey. It is possible, in principle, to examine whether there has been any change, over time, in the distribution by size of particular items of consumption, during this period. In the case of expenditure on consumer goods and services, such comparisons over time would be meaningful only if all prices had remained the same or had changed in the same proportion. In fact, prices had changed continually. Conversion of all these prices into a standard constant price involved great technical difficulties, adequate information for this purpose is also not available. No attempt has, therefore, been made to study the distribution by size of expenditure at constant prices. One way of getting over the difficulty, at least partially, of making adjustments for changes in prices would be to consider, not the actual expenditure of different fractile groups but, the relative share of expenditure.

---

\*Or, in ascending order of aggregate consumption expenditure per household as a whole. Results valid for the two types of ranking would be valid for ranking by any scale of adult equivalents.

\*\*In the National Sample Survey, estimates are usually given for a 'standard month of 30 days'.

\*\*\*That is, containing an equal number of persons of the estimated population; such groups of equal size are called 'fractile groups', in the terminology used in Fractile Graphical Analysis (F.G.A.).

**Concentration Curves:** By plotting on a graph paper the cumulative percentage shares of consumer expenditure against successive decile groups, it is possible to obtain the concentration curve for the distribution of consumer expenditure over fractile groups. If the distribution is equal, that is, in the purely hypothetical case when each person (or household) has exactly the same per capita expenditure, the concentration curve would be the same as the diagonal line at an angle of  $45^\circ$  with both the axes. In this case, if we continue to add the successive consumption expenditure of each person (or household), the accumulated sum of such expenditure would be exactly the expenditure of each person (or household), multiplied by the number of persons (or households). Therefore, the cumulative percentage share of total expenditure would be the same as the cumulative percentage of persons; all the points would then fall on the diagonal line mentioned above. The nearer the observed concentration curve is to this diagonal line of equal distribution, the greater will be the equality of distribution. Also, the farther away the observed concentration curve is from the diagonal line, the greater will be the inequality of distribution.

**Rise in the Price of Cereals:** The price of cereals was at its lowest level in rounds 8 and 9, and at the highest level in rounds 15 and 16. Relevant information on the respective price index number, period of survey, and the number of households (with about half the number in each sub-sample) which were covered in the survey in each of N.S.S. rounds 8, 9, 15 and 16, are given below:

## STATEMENT I

N.S.S. Rounds, Period of Survey, Price Index of Cereals,  
and Number of Households in Combined Sample

| <i>N.S.S.<br/>round</i> | <i>Price index of cereals<br/>1952-53 price = 100</i> | <i>Period of survey</i> | <i>Number of<br/>households</i> |
|-------------------------|-------------------------------------------------------|-------------------------|---------------------------------|
| 8                       | 77.4                                                  | July 1954-March 1955    | 1,833                           |
| 9                       | 73.3                                                  | May 1955-November 1955  | 1,680                           |
| 15                      | 105.6                                                 | July 1959-June 1960     | 7,144                           |
| 16                      | 103.2                                                 | July 1960-June 1961     | 3,703                           |

It would be seen that the price index numbers for cereals were very low, 77.4 and 73.3 (with 1952-53 price = 100), in rounds 8 and 9; the index number increased to 105.6 in 1959-60, and was slightly lower, 103.2, in 1960-61. The general increase in the prices of cereals was about 45 per cent between 1954-55 and 1959-61. The period covered by survey rounds 8 and 9 with low prices, on the one hand, and the period covered by rounds 15 and 16 with high prices on the other, therefore, supply suitable data for the study of the effect of increase in prices on the consumption of cereals.

Index numbers of average prices of cereals in rounds 15 and 16, taken together, with corresponding prices in rounds 8 and 9, taken together, (base = 100) are shown in the Statement II. Decile groups are shown in column (1) — and the corresponding index numbers are given, separately, for sub-sample 1(s.s.1), sub-sample 2 (s.s.2), and the combined sample\* in columns (2), (3) and (4), respectively, in the Statement II. Differences between the two estimates for sub-sample 1 and sub-sample 2 supply information on the margin of uncertainty of the estimates for the combined sample inclusive of both sampling and non-sampling errors. The index numbers are shown in a graphical form in Chart 1. It can be seen from the bottom line of the Statement II that the Index number for the whole (that is, 0 to 100 per cent) of the population was 145 showing that the general rise in prices of cereals was 45 per cent. For the lowest decile, or bottom 10 per cent of the population, index numbers, as shown in line 1, were of the order of 180 or 190, indicating that the price of cereals increased by 80 or 90 per cent in the case of the poorest section of the population. Index numbers for the second, third, and fourth deciles

## STATEMET II

Index Number of Average Price of Cereals in N.S.S. Rounds (15, 16)  
with Price in Rounds (8, 9) As Base=100, By Fractile Groups, All-  
India Rural

| <i>Fractile group<br/>(per cent)</i> | <i>s.s. 1</i> | <i>s.s. 2</i> | <i>combined</i> |
|--------------------------------------|---------------|---------------|-----------------|
| 0—10                                 | 178           | 191           | 183             |
| 10—20                                | 165           | 162           | 159             |
| 20—30                                | 158           | 154           | 158             |
| 30—40                                | 161           | 151           | 158             |
| 40—50                                | 154           | 142           | 149             |
| 50—60                                | 143           | 141           | 144             |
| 60—70                                | 138           | 149           | 145             |
| 70—80                                | 138           | 139           | 139             |
| 80—90                                | 135           | 141           | 137             |
| 90—100                               | 123           | 137           | 129             |
| 0—100                                | 145           | 145           | 145             |

were appreciably lower and the rise in prices was of the order of somewhat less than 60 per cent. For the fifth decile (line 5), the rise was of the order of 50 per cent. The percentage increase of prices gradually dropped in higher deciles, and was of the order of only 30 per cent in the tenth decile for the top 10 per cent of the population. The increase in the

\*The information in the National Sample Survey was collected in the form of at least two (and sometimes, more) inter-penetrating net-work of samples (I.P.N.S.). These two samples are statistically independent and equivalent, and are called the two sub-samples (s.s. 1 and s.s. 2); pooling them together one gets the combined sample, that is, the sample as a whole.

price of cereals was thus relatively much greater for the poorer sections of the people.

In order to maintain the consumption of cereals at the same physical level, the increase in expenditure on cereals of poorer households would have to be relatively much larger than the increase of expenditure on cereals of the richer people. For example, the bottom 10 per cent, or the poorest section of the population would have to incur in rounds (15 and 16) something of the order of 80 per cent more expenditure, and the top 10 per cent of the population only about 30 per cent more expenditure on cereals, in comparison with their respective expenditure on cereals in rounds (8 and 9), in order to keep the per capita consumption of cereals in rounds (15 and 16) the same in physical terms as in rounds (8 and 9).

**Changes in Shares of Cereals Consumption:** Because the actual expenditure on cereals of the poorer households would have to be relatively greater in rounds (15 and 16), in order to keep the level of consumption the same in physical terms, the share of expenditure of the poorer sections would also be relatively greater in rounds (15 and 16) in comparison with their share of expenditure in rounds (8 and 9). The cumulative proportion of the population and the accumulated share of expenditure from the bottom decile would also be higher for each decile upto the ninth decile, and would become 100 per cent in the tenth decile, that is, for the population as a whole. Relevant data for consumption of cereals in rural areas in India are given in Statement III, in which column (2) shows the cumulative percentage of population from the bottom.

The cumulative shares of the quantity of cereals consumed upto each fractile group in rounds (3 and 9) are shown in column (3), and in rounds (15 and 16) are shown in column (4). The cumulative shares of the value of the cereals consumed, that is, the cumulative shares of expenditure on cereals, are given in column (5) for rounds (8 and 9), and in column (6) for rounds (15 and 16). The corresponding figures for total expenditure are given in columns (7) and (8).

In line 1 of the Statement III, for the bottom 10 per cent of the population, it can be seen from columns (3) and (4), that the shares of consumption of cereals, in physical quantities, was 6.28 per cent in rounds (8 and 9) against 5.52 per cent in rounds (15 and 16), showing a difference of 12.1 points\* in consumption in real terms. From columns (5) and (6), it can be seen that the share of the money value of the consumption of cereals was 4.50 per cent in rounds (8 and 9) and 5.02 per cent in rounds (15 and 16), showing a rise of 11.6 points in the share expenditure of cereals. From line 11 of the Statement III, for the top

---

\*This is a measure of the difference of the two percentages expressed as a percentage of the estimate for the period of low prices in rounds (8 and 9).

## STATEMENT III

Average Cumulative Percentage Shares of Quantity and Value of Cereals Consumed and of Total Consumer Expenditure in National Sample Survey in Rounds (15, 16) (High Prices)-All-India Rural

| No.         | Cumulative percentage of population | Cereals     |               |             |               | Total expenditure |               |
|-------------|-------------------------------------|-------------|---------------|-------------|---------------|-------------------|---------------|
|             |                                     | Quantity    |               | Value       |               |                   |               |
|             |                                     | rounds 8, 9 | rounds 15, 16 | rounds 8, 9 | rounds 15, 16 | rounds 8, 9       | rounds 15, 16 |
| 1.          | 10                                  | 6.28        | 5.52          | 4.50        | 5.02          | 3.00              | 3.54          |
| 2.          | 20                                  | 13.80       | 13.24         | 10.61       | 11.96         | 7.29              | 8.54          |
| 3.          | 30                                  | 22.44       | 21.64         | 18.18       | 19.88         | 12.67             | 14.50         |
| 4.          | 40                                  | 32.46       | 31.05         | 27.12       | 28.78         | 19.05             | 21.38         |
| 5.          | 50                                  | 42.22       | 40.78         | 36.62       | 38.41         | 26.41             | 29.17         |
| 6.          | 60                                  | 52.68       | 51.26         | 47.28       | 48.84         | 35.00             | 37.98         |
| 7.          | 70                                  | 63.70       | 62.22         | 58.44       | 59.70         | 45.16             | 48.04         |
| 8.          | 80                                  | 74.74       | 73.49         | 70.43       | 71.46         | 57.47             | 59.95         |
| 9.          | 90                                  | 86.92       | 85.34         | 84.20       | 84.24         | 72.88             | 74.62         |
| 10.         | 100                                 | 100.00      | 100.00        | 100.00      | 100.00        | 100.00            | 100.00        |
| *11 top 10% |                                     | 13.08       | 14.66         | 15.80       | 15.76         | 27.12             | 25.38         |

\*The bottom line 11 gives the respective shares of the top 10% of the population, which are obtained by subtracting the figures for the ninth decile in line 9 from 100 in each of cols. (3) to (8).

10 per cent of the population, it can also be seen that the share of consumption of cereals in physical terms increased from 13.08 per cent in round (8 and 9) to 14.66 per cent in rounds (15 and 16), showing a rise of 12.1 points, while the share of expenditure on cereals remained practically the same, about 15.8 per cent. Changes in the shares of the total consumption expenditure can be compared from figures given in columns (7) and (8). It can be seen from line 1, for bottom 10 per cent of the population, that the share of expenditure increased from 3.00 per cent in rounds (8 and 9) to 3.54 per cent in rounds (15 and 16), or by 18.0 points, which was more than the increase of 11.6 points in the share of the expenditure on cereals. From line 11, it can be seen that the share of total consumption expenditure of the top 10 per cent of the population had decreased from 27.12 per cent to 25.38 per cent, showing a reduction of 6.4 points. To sum up, for the bottom 10 per cent of the population, the share of consumption of cereals decreased by 12.1 points in physical terms but the share of expenditure on cereals increased by 11.6 points, and the share of total expenditure increased by about 18.0 points. For the top 10 per cent of the population, the position was quite different. The share of consumption of cereals in physical quantities increased by 12.1 points, while the share expenditure remained the same, and the share of total consumption expenditure decreased by 6.4 points. It is clear that disparities in the consumption of cereals had increased with the rise in prices of cereals.

Estimates of cumulative shares, for different decile groups, given in the Statement III, are shown in the form of concentration curves in Chart 2. Two concentration curves for consumption of cereals, in physical terms, are shown in green; and two corresponding concentration curves for consumption of cereals in terms of money, that is, the two concentration curves for the expenditure on cereals, are shown in red. For purposes of comparison, two concentration curves for the total consumption expenditure are given in black.

In each case, the solid graphs represent conditions in rounds (15 and 16) when prices were high, and the broken graphs represent conditions in rounds (8 and 9), when prices were low. It can be seen that the broken green graph, for the distribution of consumption of cereals in physical terms when prices were low, is nearer to the line of equal distribution than the solid green graph representing the distribution of consumption of cereals in physical terms when prices were high. On the other hand, in the case of the two graphs in red (for distribution of expenditure on cereals) and also the two graphs in black (for distribution of total consumption expenditure), the position is reversed; broken graphs, representing conditions when prices were low, are further away from the line of equal distribution than the solid graphs, representing conditions when prices were high. In other words, when prices increase, the distribution of consumption, in terms of money, tends to become more equal, but the distribution of consumption, in physical terms, tends to become more unequal. It must be noted that it is only when the increase of prices of cereals (or of other goods and services) are relatively greater for the poorer sections of the population that one would expect the distribution of consumption in terms of money values (that is, of consumption expenditure) to become more equal, and the distribution of consumption in physical terms to become more unequal.

**Test of Significance of Change in Concentration:** The greater equality of the distribution of total consumption expenditure when prices are high can be examined critically with the help of the two sub-sample estimates for s.s.I and s.s.2 in the N.S.S. data for round 8 (July 1954-March 1955) and for round 16 (July 1960-June 1961) which are given in the Statement IV, and are shown graphically in Chart 3.

In the Statement IV, the cumulative percentages of the population are given in column (1); cumulative percentages of total consumption expenditure are given for sub-sample 1, sub-sample 2 and the combined sample for round 8 in column (2), column (3) and column (4) respectively; and corresponding cumulative percentages of consumption expenditure for round 16 are given in column (5), column (6) and column (7), respectively. It would be seen in the Statement IV that, for each of fractile (decile) group, all these figures for round 16 and when prices were high, are greater

## STATEMENT IV

**Cumulative Percentage Shares of Total Consumer Expenditure by Fractile Groups for Rounds 8 and 16 of the National Sample Survey: All-India Rural**

| <i>Cumulative percentage of population</i> | <i>Round 8 (July 1954-March 1955)</i> |                |                  | <i>Round 16 (July 1960-June 1961)</i> |               |                 |

| 20                                         | 7.03                                  | 7.50           | 7.26             | 8.39                                  | 8.04          | 8.21            |
| 30                                         | 12.09                                 | 13.01          | 12.54            | 14.29                                 | 13.76         | 14.01           |
| 40                                         | 18.20                                 | 19.35          | 18.78            | 21.07                                 | 20.46         | 20.75           |
| 50                                         | 25.34                                 | 26.61          | 25.98            | 28.79                                 | 28.04         | 28.40           |
| 60                                         | 33.58                                 | 35.07          | 34.33            | 37.59                                 | 36.78         | 37.17           |
| 70                                         | 43.25                                 | 45.20          | 44.23            | 47.65                                 | 46.71         | 47.16           |
| 80                                         | 54.84                                 | 57.62          | 56.22            | 59.34                                 | 58.43         | 58.87           |
| 90                                         | 69.56                                 | 73.53          | 71.55            | 73.90                                 | 73.48         | 73.65           |
| 100                                        | 100.00                                | 100.00         | 100.00           | 100.00                                | 100.00        | 100.00          |

\*No. of sample households: Round 8, 1833; Round 16, 3,703 which roughly hold the number in each sub-sample.

than the corresponding figures for round 16 when prices were high, are greater than the corresponding figures for round 8 when prices were low. The three concentration curves, for the figures given in columns (2), (3) and (4), for round 8, when prices were low, are shown in black in Chart 3; and the three concentration curves for figures given in columns (5), (6) and (7) for round 16, when prices were high, are shown in red in Chart 3. As already pointed out, in fractile graphical analysis, the geographical area bounded by the two sub-sample graphs gives the error-area of the combined graphs. Also, the 'separation' is given by the area lying between the two graphs for the two combined samples, that is, in this case, the area lying between the graph in solid red line and the graph in solid black line. It would be seen that the three graphs in red are completely separated from the three black graphs\*, and are nearer the line of equal distribution. On the basis of studies on error-areas, it may be noted that such complete separation\*\* indicates that the difference between the two distributions of total consumption expenditure during periods of high and low prices respectively, was statistically significant. It is, therefore, reasonable to think that, with an increase in prices, the distribution of expenditure on consumption did become more equal.

\*With one exception at 9th decile for round 8, namely, the cumulative per cent share 73.53 for s.s. 2 in col. (3), is slightly greater than the corresponding value 73.48 in col. (6) for round 16.

\*\*The size of the sample, i.e., the number of households (1833 in round 8, and 3,708 in round 16) was evidently adequate for establishing the statistical significance of the separation.

**Ranking of Concentration Curves by Price Levels:** The concentration curves of consumption expenditure for seven N.S.S. rounds have been placed in order of increasing concentration of distribution (that is, in order of increasing distance from the diagonal line) in column (1) of the Statement V together with several series of index numbers of prices for the rural area.

## STATEMENT V

**Ranking of Concentration Curves for Per Capita Total Consumer Expenditure of Different N.S.S. Rounds in order of Increasing Concentration (Increasing Distance from the Diagonal or Equal Distribution Line) Against Index Numbers of Prices: All-India Rural**

| Sl. No. | N.S.S. round in order of increasing concentration | National income deflator | N.S.S. price index of cereals |                   |                    | Wholesale price index (1952-53-100) |                   |                 |
|---------|---------------------------------------------------|--------------------------|-------------------------------|-------------------|--------------------|-------------------------------------|-------------------|-----------------|
|         |                                                   |                          | bottom 10 percent             | bottom 20 percent | general population | cereals                             | other commodities | all commodities |
| (0)     | (1)                                               | (2)                      | (3)                           | (4)               | (5)                | (6)                                 | (7)               | (8)             |

| 2.      | 16                                                | 107.2                    | 141                           | 133               | 118                | 103.2                               | 131.3             | 125.9           |
| 3.      | 12                                                | 100.4                    | 131                           | 126               | 111                | 103.0                               | 110.8             | 109.3           |
| 4.      | 13                                                | 102.1                    | 117                           | 116               | 108                | 98.7                                | 109.5             | 107.4           |
| 5.      | 7                                                 | 98.0                     | 100                           | 100               | 100                | 92.8                                | 104.1             | 101.9           |
| 6.      | 9                                                 | 91.9                     | 76                            | 75                | 79                 | 73.3                                | 95.5              | 91.2            |
| 7.      | 8                                                 | 90.4                     | 76                            | 79                | 82                 | 77.4                                | 100.6             | 96.1            |

Each series of price index numbers has reference to a specific field of economic activity; the different series of price index numbers are, therefore, not strictly comparable among themselves. Nevertheless, they show general agreement in the up or down movements of prices. For the rural population, it would be seen that two top curves for rounds 15 and 16 (lines 1, 2) are associated with the highest levels of all the series of price index numbers; the intermediate curves for rounds 12 and 13 (lines 3, 4) are associated with intermediate levels of prices; and finally, curves for 7, 8 and 9 rounds, at the bottom (line 5, 6, 7) are associated with the lowest levels of prices.

**Effect of Rise in Prices on Disparities:** On the whole, the higher the price level in any round of the survey, the nearer is the position of the corresponding concentration curve of total consumption expenditure to the diagonal line, that is, the greater is the equality of distribution, by size, of total consumption expenditure. Conversely, the lower the level of prices during a round of survey, the greater is the inequality of distribution, by size, of total consumption expenditure. An increase in prices is thus associated with greater equality, and a decrease in prices, with greater inequality, of distribution by size of expenditure.

**Association Between Higher Prices and Greater Equality of Distribution of Expenditure:** This observed association between higher price levels and greater equality of distribution of consumption expenditure deserves further consideration. From the Statement V, columns (6) and (7), it is seen that the increase in the wholesale prices of commodities, other than cereals, was much greater than the rise in the wholesale price of cereals, and, almost certainly, was also greater than the rise in the retail price of cereals. Secondly, the rise in the price of cereals was relatively much greater for the poorer sections of the population; and it is very likely that the rise in the price of commodities, other than cereals, was also relatively greater for the poorer people. The poorer sections of the population would have to pay relatively higher prices to maintain the same level of real consumption, and their share of total consumption expenditure would increase without, however, an increase in their share of real consumption, in comparison with sections which were better off. That is to say an appreciable increase in prices would affect poorer sections more adversely, and would generally lead to an increase of disparities in consumption in real terms. It may be noted, however, that disparities may increase, or may remain the same, or may decrease, while the absolute level of consumption changes in one direction or in another. For social justice, it is necessary that the absolute level of real consumption should increase and inequalities should also decrease. Unfortunately, a rise of prices in India was found, very often, not only to have increased disparities but also to have lowered the absolute level of consumption in real terms of the poorest sections of the population\*.

**General Conclusion:** From the information and analysis given in a separate paper\*\*, it seems likely that there was some improvement in the level of living and an increase of opportunities in many directions for most of the people of India during the first decade of planning (1951-1961). The rate of growth of consumption was still low. Benefits arising from growth also seemed to have accrued, in a larger proportion,

---

\*International comparison could not be made because it was not possible, upto 1966 or 1967, to secure, or to trace, published data, (or unpublished information to which access could be obtained) on changes in prices of cereals over time, separately, for different fractile groups or for different income brackets or different expenditure brackets, that is, separately, for households of different levels of living for any other country (not excepting, the U.K., U.S.A., U.S.S.R., Japan, etc.).

\*\*The present note is a slightly revised version of a note which was placed before the Seventh Conference of Commonwealth Statisticians in New Delhi in November 1970. The opposite effects of rise in prices on concentration of consumption in money values and in real terms were placed by the author as Chairman with other materials before the Income Distribution Committee of India in February 1964, as a draft of part II of its report. Because of differences of opinion, further studies were undertaken during the next four years. As no unanimous decision could be reached, part II of the report was published in July 1969 enclosing the detailed studies which the Committee decided would be published as a scientific paper by the author in his individual capacity.

to the richer sections of the people. In consequence, disparities between the rich and the poor did not generally decrease, but increased in many respects. The level of living is so low for a very large part of the population that it would be difficult to bring about an appreciable improvement in the absolute level of real consumption or a reduction of disparities without a large and rapid increase of income and availability of goods and services in the near future.

## **CHAPTER XIX PLANS AND PROSPECTS**

### **I. Objectives and Strategy**

The Government resolution announcing the setting up of the Planning Commission in March 1950 started with a reference to the constitutional provisions bearing on the socio-economic objectives of the Constitution. The Fundamental Rights and the Directive Principles of the Constitution assure every citizen, among other things, adequate means of livelihood, opportunities for employment and a socio-economic order based on justice and equality. Thus, the basic objectives of planning were already given in the provisions of the Indian Constitution. These were stated in the First Five Year Plan in the following words:

"The urge to economic and social change under present conditions comes from the facts of poverty and of inequalities in income, wealth and opportunity. The elimination of poverty cannot obviously, be achieved merely by redistributing existing wealth. Nor can a programme aiming only at raising production remove existing inequalities. These two have to be considered together...."

This concern for the removal of poverty has been basic to our approach and social development all through the last two decades and more. Where the bulk of the people live so close to the margin of poverty, the claim of social justice, of the right to work and equal opportunity and of a minimum level of living has obvious urgency.

The inter-relatedness between growth and social justice has been repeatedly emphasized in the Plans. It was also seen to extend to specific objectives as well. It was realized, for instance, that employment and development cannot be treated as independent of each other. This is how the First Plan viewed the problem: "In a country with vast reserves of unutilised manpower, the problem of employment has two aspects in relation to development. There is, in the first place, the need to make the maximum use of idle labour for the purpose of development. Here it is not so much a question of providing employment at existing or higher real wages but rather one of effectively mobilising all the available resources at minimum social cost. The second aspect of the problem is that of increase in pro-

ductivity of labour so that larger employment can be provided at rising levels of real income. This is, obviously, linked with the whole question of capital accumulation and technical efficiency." If productivity of labour cannot be increased in the short run, and particularly if the availability of basic essentials like foodgrains cannot be increased, a programme of full employment, designed primarily to put to work all idle labour, runs the risk of breaking down on account of excessive pressure of money incomes on available supplies. It was, therefore, the approach of the First Plan that in the first few years of development the accent should be on mobilization of idle manpower with as little increase in money incomes as possible rather than on full employment which, to be meaningful, must provide higher money as well as real incomes all round. The Plan, therefore, envisaged considerable expansion in irrigation, power, basic industries and transport and other services which would provide directly and indirectly new avenues of employment. It was foreseen that there would be problems of adjustment in the interim period when there would be a conflict between the need to reduce the social cost of maintaining unemployed labour and the need to raise productivity of labour, or the emergence of disparities between those classes in whose hands the new purchasing power went and those who had fixed incomes. These could be resolved only in the process of growth over time.

The planners were aware that a plan of development in the given conditions must in the main rely on domestic resources. There were obvious risks in excessive reliance on foreign aid. It was, however, recognized that there would be certain shortages which would tend to restrain the whole pace of development and that external resources were useful in meeting them. External assistance was envisaged to serve a two-fold purpose in this context: it would make available adequate supplies of foreign exchange, and, secondly, it would supplement the domestically generated investible resources. With a view to restricting the needs of external assistance to the minimum, the Plans accorded high priority to those lines of production which helped to reduce import requirements and increase export surpluses.

Taking into account the different objectives mentioned and taking note of the fact that in a given situation, it is necessary to assign certain relative priorities for determining an appropriate mode of action, the Plan decided to accord the top-most priority to agriculture including irrigation and power. This priority ensued partly from considerations of completing the schemes already in hand. It was further supported by the consideration that, without a substantial increase in the production of food and agricultural raw materials, it would be impossible to sustain a higher rate of industrial growth. The high priority to agriculture and to basic items of infrastructure like power and transportation inevitably limited resources available for industrial development in the public sector as well as for

expansion of social services. On the whole, the specific accent in the Plan on increase in production limited the scope for increase in social services.

The transformation of the economy that was envisaged called for an expanding and crucial role for the State. While it was appreciated that this need not result in wholesale nationalization of the means of production or elimination of private agencies in agriculture and industry, it was envisaged that there would be a progressive expansion of the public sector and a reorientation of the private sector to the changing needs of the economy. In the industrial sphere the roles of the two sectors were already defined in terms of the Industrial Policy Statement of 1948. The Government's industrial policy did not see any conflict between the two sectors. However, it underscored that private enterprise should have a social purpose and that the two sectors should function as interdependent organs of the national economy.

The analytics of the First Five Year Plan rested on a very simple model of growth. This was not explicitly presented; but it was implicit in the long-term perspective incorporated in the Plan. Such a model assumed that the rate of growth can be progressively stepped up if the proportion of the additional income that is saved and invested can be made to increase over time. It did not consider the structural difficulties inherent in the process of converting the available savings into investment. The selection of projects for Government expenditure seemed to be inspired by the ideas of providing the overhead facilities for promoting further economic development.

At the time of the formulation of the Second Five Year Plan, the objective of the socialist pattern of society came to be adopted. For the attainment of this goal it was realized that the State would have to play an increasingly active role even in areas outside infrastructure. It was deemed essential to expand public sector in the industrial field not only to initiate developments which the private sector was either unwilling or unable to undertake but also to shape the nature and pattern of investment decision in the entire economy through a acquisition of the so called "commanding heights". The public sector had also to play a special role in the context of acquisition and development of modern sophisticated technology. Since this technology required large-scale production and unified control and allocation of resources in certain major lines of activity, such as exploitation of resources in certain major lines of activity, minerals and basic and capital goods industries, it was decided that the State would have to bear the responsibility for new developments in these fields. It was implicit in this argument that public ownership and public control in these areas would present large scale and undesirable concentration of economic power.

These considerations called for a basic revision of the industrial policy

initiated in 1948. The new Industrial Policy Resolution of 1956 declared that all industries of basic and strategic importance or in the nature of public utility services would be in the public sector. It also made the State responsible for the development of these industries which were essential and required investment on a scale which only the State could undertake. Thus, the State was expected to assume direct responsibility for the future development of industries over wide areas.

The basic objectives of planned development incorporated in the First Five Year Plan were reiterated in the Second Five Year Plan. There was, however, a significant departure in that rapid industrialization and diversification of the economy was adopted as the core of development. As a logical corollary of this, it was expected that it was essential to provide for the development of basic industries and industries which make the machines needed for further development. This is how the strategy of the Second Five Year Plan emerged which reflected itself in the programmes of substantial expansion in iron and steel, non-ferrous metals, coal, cement, heavy chemicals and other industries of basic importance.

Though employment was included among the basic objectives of the Plan, it does not seem to have received as much attention as it deserved in matter of investment allocation although the 'draft outline' prepared by the late Professor Mahalanobis sought to take the facts into account through proposing special allocations to highly labour intensive activities such as the handlooms. To quote the Second Five Year Plan: "The question of increasing employment opportunities cannot be viewed separately from the programmes of investment in the Plan. Employment is implicit in and follows investment, and it is, of course, a major consideration in determining the pattern of investment." The Plan, however, further stated: "Basically, it has to be remembered, unemployment in an under-developed economy is only another aspect of the problem of development. The same factors which limit the scale of effort a community can make by way of increasing the rate of development limit also the advance in the direction of employment." Thus the Plan to a large extent relied on the expansion of employment opportunities to emerge as a fall-out from the development process after allowing for possible improvements in productivity.

While the Second Five Year Plan envisaged a substantial injection of purchasing power into the economy, the balance between the supply and demand for consumer goods was taken care of through postulating higher levels of utilization of the existing skills and equipment. In addition, it was assumed that technical improvements in the village and small scale industries sector would take place, partly through organizing them on a co-operative basis.

The objective of reduction in inequalities of incomes and wealth was sought to be achieved through fiscal devices and various institutional

changes. This was, however, qualified by the observation that in the process no damage should occur to the productive system, thus endangering the task of development itself or harm the processes of democratic change. The main thrust in this respect was in the direction of progressive taxation, expansion of social services and institutional changes in the sphere of land ownership and management, regulation of the private corporate sector, including the managing agency system, and extension of co-operative enterprise. In regard to regional disparities, the Plan claimed that these were kept in mind while formulating the programmes of development; but this was not quite explicit in the scheme of resource allocation or in the various programmes of development. In regard to industrial location, it was stated that while location of some industries was oriented towards raw material in view of the transport costs involved there was a certain amount of flexibility in respect of quite a few major industries even after allowing for the relevant economic considerations. If certain areas did not seem to qualify for an industry, it was often a reflection of the lack of an adequate infrastructure. Spatial planning for industries was consequently linked up with wider creation of infrastructural facilities.

It was realized that the magnitude and the pattern of investment in the Second Plan would involve a heavy strain on foreign exchange resources in view of the accent on accelerated industrialization. However, the foreign exchange budget presented in the Plan did not go into an explicit discussion of all the implications.

While the model underlying the First Five Year Plan was a simple variant of the one-sector growth model currently fashionable in the literature on economic development, the Second Five Year Plan was clearly based on the two-sector model of Prof. Mahalanobis. This model assumed that by increasing the ratio of current investment going into capital goods sectors it is possible to achieve a higher rate of saving and hence a higher rate of growth. The model also assumed a closed economy in the sense that it did not see the possibility of foreign trade as a source of investible funds supplementing domestic resources.

In the course of the Third Five Year Plan, there was considerable thought given to the need for ensuring a basic minimum level of consumption to the poorest sections of the society. The Plan did not adopt this as an objective to be achieved over a specified period of time. But it did get down from the general objectives of the first two Plans to more specific problems of certain sections of people and regions of the country. In an under-developed economy failure to provide "full employment" can be traced to certain fundamental deficiencies in the economic structure. Until the industrial base has been greatly strengthened, and education and other social services developed, the economy is unable to achieve a rate of growth sufficient to provide work at an adequate level of remuneration to the labour force. Poverty is most acute in areas which have

heavy pressure of population or in which, on account of scanty development of local resources, low levels of productivity persist and there is lack of continuous work. In such areas it is essential to provide for special schemes to meet the minimum needs of the people there. It was for this reason that in addition to the programmes of development for large and small industries, for agriculture and for economic and social services, the Plan provided for a large-scale programme of rural work.

Social services can be helpful in bringing about a measure of redistribution of incomes through ensuring a wider provision of certain basic necessities. This was the rationale behind the Third Plan approach to the problems of the backward areas and the weaker sections. Extension of free and universal education at the primary level, grants of scholarships and other forms of aids, and improvement in conditions of health, sanitation, water supply and housing, came to occupy a central position. Thus, programmes for the welfare of scheduled castes and tribes and other backward classes, for the provision of minimum amenities in rural areas, for local development at the village level and for the housing of industrial workers were considered as not merely extensions of social services but as vital ingredients in the scheme of economic development.

The apparent lack of emphasis on raising agricultural output in the Second Plan and the high priority accorded to it in the Third Plan must be understood in the immediate context of the two Plans. The Second Plan started with a relatively comfortable position in respect of supplies of agricultural commodities. However, two bad harvests and the shift in the pattern of investment in favour of heavy industry as well as the scheme of financing involving a significant level of deficit financing, generated considerable imbalances in the economy in the course of the Second Plan period. The Third Plan, therefore, aimed at a significant increase in agricultural output, leading to self-sufficiency in foodgrains. Significantly, the Plan laid emphasis on improvement in productivity through the Intensive Agricultural Programmes and through greater attention to applied research. This proved to be the beginning of the later Green Revolution.

The Plan recognised that inequalities arose mainly from the long established features of a traditional society, such as feudal rights and tenures or privileges and handicaps associated with the social structure. The programme of land reforms with its stress on the abolition of intermediary rights, security and rent reduction for tenants, and enforcement of ceilings on agricultural holdings was calculated to release the productive forces of the rural economy. As for income inequalities, the thinking was that though there was scope to limit the higher incomes, the disparities could be effectively reduced mainly by providing minimum incomes to the people. Ensuring minimum incomes was, however, only a part of the programme of meeting the minimum needs of the people. It was impor-

tant that the prices of essential commodities were stabilized and social services, especially, education, health and housing were brought within easy reach.

The Third Plan was much more explicit on the goal of self-reliance than the Second Plan. To quote the Plan : "Development effort in India over the Third and the Fourth Plan has to concentrate on expansion of capital goods and machine building industries—together with corresponding development of mining, power and transport—on a scale that it would enable the country to build up in this period sufficient capacity to produce domestically the bulk of the capital goods and machinery that it will require in subsequent periods for supporting high levels of investment. This is a priority that follows as much from the objective of maximising the rate of growth of the economy as from the need to attain a viable external accounts position within a foreseeable future." In other words, the objective of the Plan was to reduce substantially the dependence on assistance from abroad after a period of 10 years or so. After this period of 10 or 12 years it was expected that normal inflows of foreign capital would continue but reliance on special forms of external assistance had to be reduced progressively and eliminated. Thus, the Third Plan represented a crucial stage in the process of attaining self-reliance.

As compared to the Second Plan, the Third Plan showed much greater awareness regarding the possibility of foreign trade becoming a bottleneck to increasing the rate of investment. As a result, the investment decisions in the Third Plan were taken with an explicit attention to the role of foreign aid in breaking this bottleneck and the possible desirability of 'using aid to end aid' and reach self-sustained growth at some foreseeable future date. The Third Plan investments which continued the shift to heavy industrial sector were taken against the notion that foreign aid should enable the economy, by permitting these investments, to cross over the hump from the low growth rate equilibrium to a high growth rate equilibrium.

The conflict with Pakistan in 1965, subsequent suspension of foreign aid and devaluation of the rupee, and two successive droughts in 1965-66 and 1966-67 not only obscured the prospects for planned development, but called for a drastic review of Plan priorities. In the plans of development for the years 1966-69, as well as in the Fourth Five Year Plan, self-reliance in the sense of doing away with foreign aid in general and food aid in particular assumed particular urgency. There was also a dramatic change in the political climate of the country when the Fourth Plan was being launched. Inevitably the Plan reflected this new mood of the nation.

This is also evident from the fact that the Fourth Plan was quite specific in regard to the progress to be made in the attainment of self-reliance.

It set the target of doing away with concessional imports of foodgrains under P.L. 480 by 1971. It further aimed at the reduction of foreign aid net of amortization and interest payments to about half by the end of the Fourth Plan compared to the level prevailing on the eve of the Plan.

It was observed in the Fourth Plan that the most notable lesson to be learnt from planning in the past was that the current tempo of economic activity was insufficient to provide productive employment to all, to extend the base of social services and bring about significant improvement in living standards of the people. It also showed an awareness of the dilemma which arose in the given phase of our development. It was possible to increase employment and income opportunities for people employed in traditional industries by restricting the expansion of the modern sectors. But in the long run, increase in productivity and income of traditional industries required large capital investments for building overheads and industries supplying basic raw materials and capital goods.

The Fourth Plan observed that in the light of experience it could be stated that the basic strategy of Indian planning as defined at the beginning of the Second Plan was sound but certain new problems had cropped up in the course of further development. These indicated the need for firmer policy direction and the use of a number of supplementary measures and instruments to carry out the necessary adjustments. The most important lesson was the need to adopt measures which would maintain relatively stable conditions while development proceeded. This was particularly true in regard to agricultural production and more so in the case of supplies of food. This also related to the need for price stability.

The high priority given to agricultural production in the Fourth Plan may be understood, as observed earlier, in the context of the development which preceded the formulation of the Fourth Plan. These developments indicated the need for a shift in investment allocation away from the capital goods sector to the consumer goods sector (primarily agriculture). Two successive droughts during 1965-66 and 1966-67 exposed the inadequate growth of agricultural production in relation to the growth of population and income, and the consequent reliance of the country on P.L. 480 imports. Moreover, there was a decline in investments in the capital goods sector as a result of the fall in the availability of project aid for new projects and the slow completion of the old ones. Public investments had suffered also on account of these two successive droughts.

In keeping with the approach of giving particular attention to specific problems, the Plan provided for schemes for the correction of regional imbalances. The general approach to this problem was in terms of providing the necessary infrastructure facilities in the backward areas and certain fiscal incentives for attracting industries to these areas. The Third Plan had mentioned the need for ensuring a national minimum within the foreseeable future. The Fourth Plan further stressed this objective and

indicated that as a result of development in the Fourth Plan and the Fifth Plan it should be possible to guarantee a reasonable level of average per capita income by the end of this decade. The consumption standards of the poor would, however, remain unduly low and it was for tackling this problem that the Plan suggested a number of special schemes for small farmers, landless labourers, and people in backward areas.

The broad objectives of the Plan could thus be defined as rapid economic development accompanied by continuous progress towards equality and social justice. It was to bring a balance between growth and justice that the Fourth Plan suggested a number of special measures and programmes in those areas and for those sections which were comparatively neglected in the past. The Plan proposed detailed action through regional and local planning to help the very large numbers of the smaller and weaker producers and increase minimum employment and future employment potential.

## II. Review of Performance

Progress and performance of economic planning during the last two decades and more can be assessed in the light of the objectives set out in the preceding section and the various targets, qualitative and quantitative, set by Indian planners. On this basis, the most obvious conclusion is that Indian planning is both a success and a failure. Targets and achievements diverged in varying degrees. This was true both of the overall rates of growth as well as of the sectors and individual industries and commodities.

The First Plan envisaged that the national income, at constant prices, would increase by 11 per cent during the Plan period as a result of the increase in production provided for in the Plan. The planners thought that, out of the annual rate of increase of about 2 per cent in national income that was projected, it was necessary to plough back into investment about one fifth of it every year to achieve the required rate of capital formation. The Plan provided for an increase of about 17 per cent in the production of foodgrains, 42 per cent in cotton and 63 per cent in jute. In the case of industry no rate of growth was explicitly mentioned; but some significant developments were expected to take place during the Plan period. The development programme in the public sector provided for a new iron and steel project and a heavy electrical equipment plant.

The pattern of development expenditure envisaged in the Plan broadly underlined the priority given to agriculture. More than a quarter of the public sector outlay was earmarked for agriculture, community development and irrigation. Further, there was another 13 per cent provided for multi-purpose irrigation and power projects. The share of industry was a bare 8 per cent. About one-sixth of the outlay was meant for social services. As for the priorities in the field of industries, about 26

per cent of the total investment in the public and the private sector was expected to go into the metallurgical industries, 20 per cent into petroleum refining, 16 per cent into engineering industries and 8 per cent into the manufacture of heavy chemicals, fertilizers and pharmaceuticals. Thus, relatively small investments were envisaged in other industries, mainly consumer goods. About 80 per cent of the private sector investment envisaged in industry was in respect of capital goods and producer goods. In the field of health, the priorities centred round preventive health care by way of provision of water supply and sanitation and control of epidemics like malaria. And in the field of education the highest priority was accorded to the Constitutional directive of universal primary education.

The actual performance of the Plan proved to be highly encouraging in certain fields while not so in certain others, such as social services. National income increased by about 18 per cent and per capita income by 11 per cent; foodgrains production went up by 20 per cent and the production of cotton and of jute went up by 45 per cent and 64 per cent respectively. The index of industrial production registered an improvement of 22 per cent. However, the work on the construction of the public sector iron and steel plant and the heavy electrical equipment plant could not be started in the Plan period. This was perhaps a serious lapse, considering the growing requirements of the economy for steel and electrical machinery. The rate of investment as a proportion of national income rose significantly from 4.9 per cent to 7.3 per cent. This was a major breakthrough in an economy which was stagnant for decades before.

In spite of these encouraging developments, the overall problem of poverty remained unaltered at the end of the Plan. The investment undertaken in these five years was not on a scale sufficient to absorb the estimated new entrants to the labour market which added to the backlog of unemployment and under-employment.

The principal task as defined by the planners for the Second Five Year Plan period was to secure an increase of national income by 25 per cent, to enlarge employment opportunities at a rate sufficient to absorb the increase in labour force and to take a major stride in the direction of industrialization. While the Second Five Year Plan was a continuation of the development effort initiated by the First Plan, there was a major shift in priorities with a larger accent on industrialization, especially on the development of heavy industries and the necessary infrastructure like transport and power. It was expected that by the end of the Plan period investment as a per cent of national income would go up from 7.3 per cent to 10.7 per cent and domestic savings from 7.0 to 9.7 per cent. The crucial role that the public sector was expected to play was also clear in that the ratio of public to private investment in the Second Plan was expected to

be 61:39 as against the parity postulated in the First Plan.

Over the Second Plan period foodgrains output was estimated to grow by 15 per cent and the overall agricultural production by 18 per cent. These ratios were to be compared with 20 per cent and 15 per cent achieved in the preceding five years. The Second Plan, however, placed more emphasis on diversification of production in keeping with the changing requirements. With a special priority given to industrial development, it was expected that the net output of factory establishments would increase by 64 per cent in the Plan period. The emphasis on capital goods industries could be seen from the fact that the net output of these industries was expected to increase by 150 per cent. However, it must be remembered that their base level of production was particularly low.

The change in priorities was entirely reflected in the pattern of outlays and investment envisaged in the Plan. Of the public sector outlay about 12 per cent was provided for agriculture and community development as against over 15 per cent spent in the preceding five years. On the other hand, the provision for industry and mining was as much as 18.5 per cent as against 7.6 per cent in the First Plan. It must be appreciated that the Second Plan ratios related to a total public outlay which was more than double the outlay in the First Plan. In absolute terms the step-up in the outlay on industries and mining was very large—nearly 400 per cent. It may also be observed that the actual outlay under this head in the first Plan was less than 50 per cent of the allocation. The Plan provided for an increase of over 190 per cent in the output of iron ore, over 230 per cent in finished steel and aluminium, 300 per cent in machine tools (graded) and substantial increases in various types of machinery, heavy chemicals and fertilizers.

The Plan ran into unexpected balance of payment difficulties from the very start and had to be reappraised in 1958. Stringent restrictions had to be imposed on less essential imports. As a result, many of the targets of the Plan could not be achieved. There were serious slippages in the construction schedules of a number of major industrial projects. The increase in national income achieved during the Plan proved to be only 20 per cent against a target of 25 per cent. There were similar shortfalls in the crucial sectors of agriculture and industry. The index number of industrial production recorded a cumulative rate of expansion of about 7 per cent. This was significantly lower than what was envisaged, viz., 11 per cent; but still quite high in comparison with the achievements at any time in the past. There were large shortfalls in some of the individual industries. Unfortunately, they occurred in areas which were of crucial importance for future growth. The actual production of finished steel was barely half of the Plan target. The production of nitrogenous fertilizers was only about 35 per cent of the target. There were similar shortfalls in respect of various categories of industrial machinery

and industrial products like heavy chemicals, cement, and newsprint. Another important deficiency in the implementation of the Plan was in regard to the escalation of cost estimates of many important projects.

While the rate of capital formation realized in the terminal year of the Plan at 11.5 per cent of national income was higher than the anticipated rate, viz., 10.7 per cent, the targeted rate of domestic savings was not achieved. It turned out to be only 8.5 per cent of national income against the target of 9.7 per cent. This implied a substantial draft on external assistance.

Considering the first ten years of planning, it can be seen that, while there were many ups and downs in the economy, the overall progress was quite substantial. Agricultural production expanded by about 41 per cent and output of foodgrains by 46 per cent. The net output of organized manufacturing industries nearly doubled. There was a significant accretion of strength to the public sector in the field of industry. National income increased by about 42 per cent and per capita income by 16 per cent. The production of steel ingots went up by 150 per cent. There was a major break-through in the field of oil and petroleum refining. The total investment in the economy exceeded 10,000 crores. The total public outlay on agriculture, community development, and irrigation amounted to Rs. 1550 crores or close to 25 per cent of the total public outlay. Net area irrigated went up from 15.5 million acres in 1950-51 to 70 million acres in 1960-61. There was all round development in the field of education. The number of students attending schools increased substantially, though the target of universal primary education was still far off. There was also considerable success in the provision of health services. Considerable success was achieved in regard to the control of communicable diseases. The employment situation apparently worsened as even the additions to labour force could not be provided jobs out-side agriculture. Some limited effort was made in the direction of development of backward areas through the location of large Central projects. The location for the three new steel plants, viz. Bhilai, Rourkela and Durgapur, the Heavy Machinery Plant at Ranchi, the Heavy Electricals Project at Bhopal and the Neyveli lignite complex were examples of this approach.

The Third Five Year Plan aimed at an increase of 5 per cent per annum in the national income. For achieving this rate of growth the Plan estimated that the rate of investment would have to go up from 11.5 per cent to 14 per cent at the end of the Plan period. This called for raising the rate of domestic savings from 8.5 per cent to 11.5 per cent. The per capita income was in the meanwhile expected to increase from 330 in 1960-61 to Rs. 385 at the end of the Plan period i.e. by about 17 per cent. One of the major objectives of the Plan was to achieve self-sufficiency in foodgrains.

The sectoral targets set by the Plan were indicative of relative empha-

sis on different objectives of the Plan. The high priority given to agriculture was clear from the fact the agricultural production was expected to go up by 30 per cent and foodgrains production by 32 per cent. Industrial production was expected to go up by 70 per cent or at the rate of 11 per cent per annum. Significant increases were envisaged in the output of steel, aluminium, machine tools, etc. The most significant development during the Plan period, as far as the industrial sector was concerned, was the rapid growth of machine-building and engineering industries. It was estimated that the development programmes in the Plan would create additional employment opportunities to the extent of about 14 million as against the increase in labour force of 17 million. The balance was proposed to be taken care of through large scale rural works programme, village and small industries, etc.

The pattern of investment adopted by the Plan reflected the set of priorities discussed above. The high priority given to agriculture was to be seen in the fact that 20 per cent of the total investment was earmarked for agriculture, community development and major and medium irrigation as against 18 per cent spent in the Second Plan. Considering the substantial step up in the investment proposed in the Third Plan as compared with Second, the absolute increase in the provision becomes evident. The share of organized industries and minerals in the Third Plan at 25 per cent of the total investment was only marginally higher than that in the Second Plan at 23 per cent but in the absolute terms the provision was higher by over Rs. 1,000 crores.

The actual progress achieved during 1961-66 fell much below the targets. In the last year of the Plan there was actually a fall in the national income as a result of serious drought and the conflict with Pakistan. Except for 1964-65, agricultural production did not show any increase and large imports of foodgrains had to be continued. Food imports amounted to 25 million tonnes during the five years of the Plan. Cotton and jute imports amounted to 3.9 and 1.5 million bales respectively. The slow rate of growth in agricultural production depressed the rate of growth of the entire economy. The production of organized industry increased by 8 or 10 per cent during the first 4 years; but slowed down to 5.3 per cent in the last year. Over the Plan period as a whole the annual rate of growth turned out to be 8.2 per cent compared to the target of 11 per cent.

These shortfalls in domestic production occurred at the same time as total spending in the economy was rising both in the public and the private sector. As a result, there was a steep increase in prices especially in prices of agricultural commodities. The rate of domestic savings rose to 10.5 per cent of national income by the end of the Plan as against the ratio of 11.5 per cent anticipated in the beginning. The rate of capital formation rose from 11.5 per cent of national income to about 14 per

cent. The effort at resource mobilization was, however, quite impressive. The ratio of tax receipts to national income which had increased from 6.6 per cent in 1950-51 to 9.6 per cent in 1960-61 rose further to 14 per cent in 1965-66. However, non-developmental expenditure increased much faster eating away resources so mobilized. In addition, there was serious pressure on exchange reserves and greater resort to external credits for financing capital formation.

Thus the planning process suffered a serious setback by the events of the early sixties. However, certain encouraging long term trends were perceptible in the economy. For example, the rate of growth in the First Five Year Plan period was 3.4 per cent, in the Second Five Year Plan period 4 per cent and in the Third Five Year Plan period, 4.2 per cent (excluding 1965-66 which was an abnormal year). These statistics belied the thesis of stagnation and lack of growth of the Indian economy. This growth must be seen in historical perspective. It must be remembered that for decades prior to the adoption of planning the rate of growth was barely 1 per cent per annum. Even in agriculture, where the progress had been unsteady, the compound rate of growth achieved between 1950-51 and 1964-65 was 3 per cent as against an average rate of less than  $\frac{1}{2}$  per cent per annum in the preceding decades. Thus the Five Year Plans had certainly broken the stagnation of the economy even though the rates of growth were below the targeted levels and would appear modest and even unsatisfactory in the light of the actual requirements of the people. It is also to be remembered that the population of the country had been increasing at the rate of, over two per cent per year neutralizing a large part of the recorded growth. If national income registered an increase of 69 per cent during this period, the increase in per capita income was only 28 per cent.

The difficulties created by the drought of 1965-66, the conflict with Pakistan, devaluation of the rupee and suspension of foreign aid were further multiplied by another drought and the industrial recession that followed. While some of the factors responsible for these events were beyond the control of the nation, there were a number of lapses which could have been avoided. Despite large outlays there were serious shortfalls in achieving the Plan targets. Delays in construction, escalation of costs and the failure to utilize capacities fully further contributed to our difficulties. The three Annual Plans (1966-69) were more in the nature of a holding operation. The record harvest of 1967-68 and the signs of industrial recovery evident in 1968-69 prepared the ground for launching the Fourth Five Year Plan.

The launching of the Fourth Plan was delayed by three years on account of the setback to the economy during the period 1965-66 to 1968-69. The Plan became operative only when the economy was restored to satisfactory health comparable to that which it enjoyed towards

the end of the Third Plan. There was recovery in agricultural production starting from 1967-68 and in 1969-70, there was a record production of 100 million tonnes. The industrial recession of 1966 and 1967 was also overcome by the beginning of 1968 and there was an increase of over 6 per cent in industrial production in 1968-69. The price situation also had achieved a measure of stability. During 1966-67, which was a drought year, wholesale prices increased by 16 per cent. They rose further by 11 per cent next year. However, they were relatively stable during 1968-69 on account of the substantial increase in foodgrains production. Thus the conditions augured well for a fresh phase of stable growth.

The economy was expected to achieve an overall annual increase of 5.5 per cent in total production during the Fourth Plan. Consistent with this overall rate of growth, agricultural production was expected to rise at an annual average rate of 5 per cent while industrial production at about 9 per cent. It was estimated that aggregate savings would rise from 8 per cent of the national income in 1968-69 to 13.2 per cent in 1973-74. A significant increase in public savings was expected. From 1.4 per cent of the national income in 1968-69 they were estimated to rise to 4.5 per cent by the end of Plan period. A total outlay of Rs. 24,882 crores was envisaged for the Fourth Plan. Of this Rs. 15,902 crores were in respect of the public sector plan and Rs. 8,980 crores for the private sector. Public sector outlay consisted of Rs. 13,655 crores of investment and Rs. 2,247 crores of current development outlay. Thus the total investment in the economy during the five years of the Plan was estimated at Rs. 22,635 crores. The scheme of financing was envisaged to be non-inflationary since the Plan only provided for Rs. 850 crores by way of deficit financing.

The Plan started off on an optimistic note. Against the projected overall rate of growth 5.5 per cent per annum, the economy experienced a rate of growth of 5.2 per cent in 1969-70. Soon, however, the deceleration set in. The growth rate fell to 4.2 per cent in 1970-71 and plummeted to 1.7 per cent in 1971-72 and 0.6 per cent in 1972-73. The year 1970-71, however, recorded the highest ever production of foodgrains of 108 million tonnes but the rate of growth was depressed because of the poor showing in mining and manufacturing and transport sectors. In 1971-72, on the other hand, the rate of growth of industrial production picked up but was offset to some extent by a sharp setback and overall decline in agricultural output. This trend was further reinforced in 1972-73 while the industry showed a further modest improvement.

Agriculture had a very bad year on account of widespread drought. It is estimated that the rate of growth recorded during 1973-74 was around 4 per cent which was mainly accounted for a revival of agricultural production. The improvement in agricultural production in the terminal year of the Plan must, however, be viewed in the context of two bad years.

In fact, the level of output in 1973-74 did not even reach the level attained in 1970-71.

In respect of savings and investments also, the tempo does not seem to have been sustained after the initial recovery registered during the early years. Both savings and investment in the economy seem to have reached their peak levels in 1965-66. After that the savings ratio tended to decline in 1969-70 when it picked up again and is estimated to have reached the level of 11 per cent in 1971-72. Probably there was some further increase in the ratio in 1972-73. The ratio of net investment to net domestic product at market prices reached 14.7 per cent in 1965-66. Thereafter, it declined to 10.8 per cent in first year of the Plan. The fall in the investment ratio during this period was steeper than the fall in the savings ratio because of the simultaneous decline in net inflow of foreign resources. There was, however, an increase in the investment ratio after 1969-70 and it reached the level of 12.2 per cent in 1970-71. It is estimated to have remained stable at this level in 1972-73. It is unlikely that it would have improved in 1973-74.

It can be observed from the annexed Table that there were serious shortfalls in the Fourth Plan in regard to the achievement of the various targets. In spite of the improvement in agricultural production in 1973-74 the output levels in most cases were not significantly different from the corresponding levels in 1970-71. This constitutes a cause for serious concern. It has been observed that while the growth of productivity in the case of wheat has slowed down, there has been no acceleration in the productivity of other foodgrains. The new high yielding varieties of seeds have not so far made any significant impact on the production of rice and coarse grains. There has also been no breakthrough in the production of oil seeds and pulses.

In the industrial sector, performance in certain critical areas such as steel, power and fertilizers was particularly unsatisfactory. Apart from normal factors like inadequate availability of raw materials, transport bottle-necks, labour unrest and low level of industrial investment and management problems which have restrained industrial activity in the recent past, there has been widespread shortage of power during 1973-74. Inadequate maintenance and insufficient attention to operational efficiency in generation and transmission of power have been the major causes of fall in power production.

These crucial shortfalls combined with large non-developmental expenditure which the Government had to incur on account of Bangla Desh and famine relief exerted continuous strain on prices. While prices rose on an average by 7.8 per cent in 1972 the wholesale price index went up by as much as 19.2 per cent in 1973. The rise in prices during 1973 was led by the prices of food articles and industrial raw materials, but in the middle of 1973 prices of manufactured goods emerged as a more im-

portant factor in price inflation. Prices of both intermediate products and finished products increased substantially during the period. The prices of intermediate products increased partly because of a steep increase in international prices of non-ferrous metals as well as due to a substantial increase in the prices of iron and steel. The energy crisis leading to sharp increase in imported oil prices added a fresh and substantial dimension to the price problem.

On the balance of payments front the performance of the Plan presented once again a mixed picture. A bright spot in the picture was provided by buoyancy in our exports witnessed during the second half of the Plan period. Exports increased by about 22 per cent in 1972-73 and by about 24 per cent in 1973-74 as against the increase of only 4.8 per cent in 1971-72. So far the year 1974-75 points in the same direction. There is no doubt that certain special factors have played their part in what would appear to be a piece of very impressive performance on the export front. It cannot, therefore, be taken for granted that a break-through has been achieved on the export front. However, as a result of current world inflation and consequent increase in wage levels in developed countries, our competitive strength in a number of manufactured commodities has increased.

The imports fell by 1.5 per cent in 1972-73, but there was a spectacular rise of over 45.0 per cent in 1973-74 mainly because of the very sharp rise in prices of such items as crude oil, non-ferrous metals and food-grains. As a result, the balance of payments position is under considerable pressure.

Recent developments in the international economy have to be viewed alongside with a sharp increase in the domestic price level. There is no doubt that the economy is at present under severe strain. The improvement in agricultural production has followed two successive lean years. The rising trend in our exports is certainly an encouraging factor in the situation but by itself may not be adequate to cope up with the balance of payments problem. We need a sharp increase in production to tide over the present difficulty. An encouraging factor is the improvement in the working of some of the major public sector undertakings. However, there is still considerable unutilized capacity in some major public sector undertakings such as steel and fertilizers. These represent important potentialities that need to be tapped effectively.

As a result of the uncertainty created by the unfavourable developments mentioned above, finalization of the Fifth Plan has so far been held up. Draft Plan has been formally inaugurated and is being implemented through Annual Plans. Decision relating to the finalization of the Fifth Plan will have to be taken fairly soon. There is little justification for any talk about a plan holiday. Those who argue in favour of withholding the Fifth Plan till such time as normal conditions are restored may be

taking an unduly short-sighted view of the planning process, while there is no doubt that no effective planning is possible unless a certain measure of economic stabilization has been achieved.

A balanced view will need to be taken which will combine the short term imperatives of the situation with the requirements of medium and long term growth as worked out in the Draft Plan.

### III. An Assessment

In the light of the review of performance of development Plans so far, an overall balance sheet of successes and failures may now be attempted. On the success side one can point out that India has recorded substantial increases in the production of foodgrains. The rate of growth in the output of foodgrains in the last 20 years has far exceeded the compound rate experienced in the preceding half century. Similarly an enormous degree of diversification of the industrial base has been achieved during these years. Coupled with this there has been considerable expansion of infrastructure in terms of transport, general education as well as in technical education. In spite of all these achievements, it has to be admitted that improvement in the living standards of the general population leaves a great deal to be desired. This is particularly true with respect to production of essential commodities that sustain life for the vast masses of the people as well as their ability to appropriate to themselves a significant share of the incremental output.

Many of the failures of Indian planning are ascribed by some to the wrong strategy and priorities adopted by the planners. It may, however, be pointed out that the basic strategy of planning in this country has stood the test of time. If an impression still persists that these failures have been due to wrong objectives or strategy, it is mainly because of misunderstanding of certain essential problems inherent in the business of Plan formulation and implementation in a developing economy which has accepted the political framework of democratic planning.

It is, for instance, argued by some that Indian planning was concerned more with growth than with the redistributive aspect with the result that the latter has suffered grievously in the process. It has been made abundantly clear in the foregoing discussion that the Five-Year Plans were never designed to achieve the maximum rate of growth of national income nor were they fashioned in such a way that one could expect a radical transformation of the society in terms of property relationship within a specified time range. Indian planning has always had a variety of objectives before it, which included things such as a rapid rise in the level of national income, deconcentration of economic power, balanced regional development and wider diffusion of social services, such as education and health.

It will be, therefore, appropriate to review the progress of planning in India with reference to these various objectives. While any proposition involving the rate of growth over a long period of time is beset with many difficulties, quite apart from the fact that no single rate of growth in itself can measure the production performance of an economy, the Indian Planning has been only a modest success in terms of the recorded rate of growth. The rate of growth over the planning period as a whole has been below 4 per cent. Judged by the fact that population has been growing at a rate somewhat above 2 per cent it is quite clear that per capita income has increased at very modest rate. It is only when one takes into account significant increases in the industrial potential created by the large scale investment in strategic sectors that one can say that a basis has been laid for sustained growth in the future. Similarly in agriculture the rate of growth has been subject to considerable vicissitudes and the compound rate of growth on a long term basis has not exceeded 3 per cent. Moreover, there have been distinct phases in the growth experience of the country. Income from agriculture and allied activities increased at an annual rate of 2.8 per cent where as industry including construction, electricity, etc., increased at a rate of 6.5 per cent over the period 1950-71. Within the category of industry, large scale manufacturing increased at the rate of 7.4 per cent whereas electricity grew at the rate of 12.6 per cent. Gross production levels for the industrial sector naturally increased at faster rates. From 1965-66 onwards the growth process has been subject to considerable fluctuations in terms of the rate of growth and, in the case of agriculture, in terms of absolute levels as a whole. These fluctuations can be seen for a few major sectors from the following Table :

TABLE I  
Income by Industrial Origin

(Rs. Crores at 1960-61 prices)

|                                      | 1964-65 | 1965-66 | 1966-67 | 1967-68 | 1968-69 | 1969-70 | 1970-71 |
|--------------------------------------|---------|---------|---------|---------|---------|---------|---------|
| (1)                                  | (2)     | (3)     | (4)     | (5)     | (6)     | (7)     | (8)     |
| 1. Agriculture                       | 7747    | 6695    | 6675    | 7791    | 7803    | 8195    | 8633    |
| 2. Mining and manufacturing          | 3010    | 3058    | 3136    | 3210    | 3342    | 3514    | 3656    |
| 3. Electricity, gas and water supply | 146     | 161     | 175     | 195     | 221     | 242     | 261     |
| 4. Construction                      | 777     | 744     | 771     | 846     | 820     | 875     | 927     |

It is interesting to analyse the trends in sectoral productions, as revealed in the above Table. First, change in agricultural production in a downward direction have influenced activities in other sectors to a great

extent. Secondly, revival in agriculture has not had as much of a trigger effect on the rest of the economy as one would have predicted. Thirdly, economic policy has not been able to offset the outside disturbances which have been fairly pronounced over this period. And lastly the average rate of growth of agricultural output as a whole has not been significantly different during the last 7 or 8 years as compared with the earlier decade and a half.

The story of savings and investment is no different. There has been a retrogression from 1964-65 onwards in the rate of savings and investment. Leaving out the year 1965-66, which was somewhat unusual, net domestic saving as a percentage of net domestic product was 9.8 per cent in 1964-65 whereas in 1970-71 it was only 8.6 per cent. It is clear from these figures that the revival of national income in recent years has been accompanied by a falling saving-income ratio.

What are the reasons for this complex situation? Analysing the economic factors, the major factors in the situation appear to be the shift in the distribution of income from urban to rural areas, growth in public consumption and failure of the fiscal system to mop up the extra incomes generated. There are critics who are inclined to put the blame on the strategy for industrialization that was adopted at the time of the Second Plan. There is no clear and comprehensive study by the critics which show that a different strategy for industrialization would have served our needs better. It is not clear that the planners had chosen an inappropriate product for the economy. The argument that there has been a relative neglect of agriculture is not borne out by statistical evidence that we have at our disposal.

It has been observed earlier that agriculture enjoyed increasingly high priority in the First Three Plans. In recent years the urgency to increase agricultural production has further increased and the importance of this has been recognized by the planners in as much as the farmer is guaranteed of minimum prices, high yielding seeds, adequate fertilizers, and irrigation facilities. A break-through has been achieved in wheat cultivation with the introduction of the high yielding varieties. This has removed the limitations set by the existing crop varieties to the package programme introduced in the early sixties. The new strategy in agriculture is concerned not only with higher yield, but with greater intensity of cropping. Entirely new crop relations have been made possible by the development of short duration varieties of paddy, maize, *jowar* and *bajra*. The new multi-cropping programme was introduced in 1967-68 and has been strengthened from year to year. Agricultural technology as a major input of agriculture production has received special emphasis. During 1951-69 the total public expenditure on agriculture and allied services amounted to Rs. 4930 crores out of a total of Rs. 21,892 crores. In addition, there was sizeable private investment. The significant expansion

in agriculture inputs during the last two decades is evident from the following Table:

TABLE II  
Progress in Use of Agricultural Inputs

|                               |               | 1950-51 | 1960-61 | 1968-69 | 1973-74 |
|-------------------------------|---------------|---------|---------|---------|---------|
| 1. Nitrogenous (N)            | '000 tonnes   | 55      | 210     | 1208    | 1835    |
| 2. Phosphatic $P_2O_5$        | „             | neg.    | 70      | 382     | 634     |
| 3. Potassic $K_2O$            | „             | nil     | 26      | 170     | 314     |
| 4. Plant protection           | '000 hectares | n.a.    | 6400    | 27800   | 60594   |
| 5. Tractors                   | '000 nos.     | 8.6     | 31.0    | 91.0    | 203.0   |
| 6. Power tillers              | „             | nil     | nil     | 6.0     | 10.0    |
| 7. Pump sets (electric)       | „             | 18.7    | 191.9   | 1088.7  | 2439.0  |
| 8. Pump sets (Diesel)         | „             | 65.8    | 230.0   | 837.0   | 1510.0  |
| 9. Short and medium term loan | Rs. crores    | 22.9    | 203     | 504     | 750     |
| 10. Long-term loan            | „             | 1.33    | 12      | 148     | 200     |

As a result, significant improvements in production and productivity have been achieved during the last two decades. The improvements in production and productivity are brought out in the following Table:

TABLE III  
All-India Compound Rates of Growth of Agricultural Production, Area under Crops and Agricultural Productivity during 1949-50 to 1968-69

| (per cent per annum) |                   |             |                     |
|----------------------|-------------------|-------------|---------------------|
| Crop<br>(1)          | Production<br>(2) | Area<br>(3) | Productivity<br>(4) |
| 1. Rice              | 3.02              | 1.22        | 1.78                |
| 2. Wheat             | 4.20              | 2.26        | 1.90                |
| 3. Cereals           | 3.00              | 1.17        | 1.82                |
| 4. Pulses            | 1.16              | 1.26        | (-) 0.10            |
| 5. Foodgrains        | 2.79              | 1.19        | 1.65                |
| 6. Oilseeds          | 2.86              | 2.31        | 0.53                |
| 7. Cotton            | 3.93              | 1.91        | 1.98                |
| 8. Jute              | 2.29              | 2.03        | 0.27                |
| 9. Fibres            | 3.49              | 1.94        | 1.52                |
| 10. Non-foodgrains   | 3.18              | 2.19        | 0.97                |

It can be seen that aggregate agricultural production rose at an average of 2.92 per cent per annum, foodgrains at 2.79 per cent and non-

foodgrain crops at 3.18 per cent. Over half of the increase in total crop production was derived from higher yields per hectare. The remainder represents the contribution of area growth estimated at about 1.37 per cent per annum. Judging by the relative movement of area and production in the last few years there would appear to be a marked deceleration in area growth. As regards yield rates, there seems to be a significant difference between food and non-food crops. Even among the foodgrains the output of pulses has increased only about less than half as fast as that of cereals. What is more disturbing is the decline in the average output of pulses per hectare.

Critics have also found fault with the policy of import substitution *vis-a-vis* export promotion. The import substitution pattern of development, where the growth of so-called heavy industries has played an important part, has been criticized as being especially expensive. It is argued that if the same amount of investment had been used for developing industries with high potential for exports, the resulting allocation would have proved much more beneficial for the economy. On the abstract plane, such an argument is maintainable if it could be assumed that the basic aim of the Indian planners was maximization of current level of consumption. However, given the fact that Indian planning had a multiplicity of objectives before it, which included among other things, a desire for self-reliance with a need for a structural transformation of the technological base, the purely abstract argument does not clinch the issue.

If the progress towards self-reliance appears tardy and insubstantial, the reason does not seem to be that the basic strategy in this regard was faulty. This must be attributed to three factors : (1) misdirected investments in the private sector; (2) failure of public sector projects to materialize as planned; and (3) changing needs of the economy, particularly in respect of sophisticated equipment and materials, and inadequate progress in catching up with advancing technology. It was expected that the country's capability of meeting its investment requirements through import substitution, internal surpluses and export earnings would be adequately developed to eliminate or substantially reduce the balance of payments deficit. However, today we have on hand substantial unutilized capacity in the heavy investment sector. Failure to adopt proper maintenance practices; disturbed labour relations and lack of co-ordinated development in different sectors have been responsible for this phenomenon. As a result, the economy is facing serious shortages of steel, power, fertilizers, cement and non-ferrous metals which have enlarged the balance of payments gap beyond the unavoidable level. The encouraging spurt in non-traditional exports has received a setback because export availabilities have been reduced by scarcity of key raw materials which were expected to be produced by the core sectors.

With regard to the problems of balanced regional development,

it must be admitted that [the] Indian planners did not operate on the basis of a well-formulated strategy in this regard. The absence of a strategy has been particularly conspicuous with respect to the location of industrial projects and the highly selective nature of the growth process initiated in agriculture. There is no doubt that the existing disparities with which the era of planning began have been changed in the course of the planning process. Whether this has led to an accentuation of the index of regional inequality compared with the base level, is not, however, clear. Even then, it is necessary to be extremely careful in this respect, from a long range of point of view. It can be seen from the following Table that more recently certain States have grown much faster than the others, a process which does not appear to have been reversed even according to the latest indications.

TABLE IV  
Disparities in Per Capita Income in Different States

|                   | [Rs. current prices] |         |
|-------------------|----------------------|---------|
|                   | 1964-65              | 1969-70 |
| Punjab            | 575                  | 1002    |
| Maharashtra       | 526                  | 756     |
| Gujarat           | 523                  | 740     |
| Haryana           | 504                  | 902     |
| West Bengal       | 498                  | 706     |
| Assam             | 441                  | 586     |
| Andhra Pradesh    | 438                  | 544     |
| Tamil Nadu        | 434                  | 591     |
| Karnataka         | 420                  | 571     |
| Kerala            | 393                  | 643     |
| Uttar Pradesh     | 376                  | 497     |
| Madhya Pradesh    | 373                  | 495     |
| Rajasthan         | 336                  | 478     |
| Orissa            | 347                  | 545     |
| Jammu and Kashmir | 141                  | 503     |
| Bihar             | 229                  | 402     |

It is difficult to assess objectively the performance of the economy with regard to the objectives of reducing concentration of income, wealth and, more generally, economic power. It may, however, be instructive to make a selective survey of trends perceptible in certain vital sectors. In the agrarian sector, the role of non-functional intermediaries like the zamindars has been considerably reduced. In regard to the tenancy legislation, the net gain for the under-privileged sections does not seem to be significant. Much of the tenancy has gone underground. Two types of tenancy changes

have been observed, one from the 'big'. Usually the poor have gained much less than the rich in the process of leasing out land. In the wake of the Green Revolution, insecurity of tenancy seems to have increased resulting in a considerable number of cases of eviction. There has been some increase in capitalist farming, though its nature and scope would appear to be limited. The relatively slow growth of non-agricultural economy has only further led to the pressure on land, increase in gross sown area has not led to any reduction in the numbers seeking jobs on the farms since the benefits of irrigation facilities, especially irrigation water available from private sources, have mostly gone to the richer farmers. The initial beginning in the direction of mechanization of agriculture has further accentuated the problem of pressure on land.

Summing up, one can say that though there have been some significant structural changes resulting in a considerable increase in agricultural production, there does not seem to have been any material change in the distribution of incomes or wealth in rural India. Probably this observation might have to be modified with reference to different periods. For instance, in the initial decade of planning, with the abolition of intermediary tenures and a step-up in public investment in agriculture, there was some improvement in the distribution of income and wealth in favour of the poorer sections. From the middle sixties, however, there has been considerable private investment supported by liberal Government credit to the more well-to-do sections of the rural society. This seems to have resulted in the accentuation of economic inequality.

In regard to the distributional issues connected with the industrial sector, there are several inter-related problems. There has been considerable public discussion about the increasing economic power of the large business houses. Several commissions and committees have looked into this matter in some detail. One factor contributing to this phenomenon of the big becoming bigger, it is stated, is that in the very process of planning there is an accentuation of disparities. It is quite clear that the system of industrial licensing that has been operated has proved neither particularly efficient nor egalitarian. However, in carrying out a complete assessment of this situation it is very important to keep in mind a few related phenomena. First of all, one should remember that the whole structure of institutional finance has altered in the course of the last two decades of planning. This indicates significant possibilities for achieving reduction in concentration of economic power. Secondly, the scope of the public sector has expanded considerably. With better management and an improved framework for decision making in public enterprises, the public sector can play an important role in the economy which it has not done so far. Thirdly, if the rate of growth of output in the core sectors in the economy can be stepped up, small scale sector can play a very important role in generating additional income and employment to a

larger number of people.

In the field of education we now have a pool of well qualified and technically trained personnel. In recent years certain categories of skilled manpower have had great difficulties in securing jobs. Some others have placed the blame for this on faulty planning in this sector. However, a large part of this criticism would appear to be misplaced. The emergence of unemployment in this area is very closely co-related with the slowing down of the rate of growth of industrial production. Mistakes in demand forecast can be largely explained by a series of decisions taken in sectors which lie outside the educational system. There are, however, some very glaring failures in the field of education. The Constitutional Directive regarding universal elementary education has not been fulfilled, even after 25 years of independence. The rate of growth of literacy has been lower than the rate of growth of population with the result that there is an increasing number of illiterates in the country. The rate of growth of enrolments at higher levels of education has exceeded the rate of growth at lower levels which has affected the structure of the educational climate adversely, given the fact that higher education is meaningful only if sufficient quality is maintained. There is a large degree of wastage and stagnation in the educational system. And, finally, the whole process of educational expansion has been marked by an indiscriminate use of subsidies much of which has accrued to the more affluent sections of the community. The total result of this has been that the contribution of the educational sector towards the equalization of economic and social opportunities has been very modest. It is, however, necessary to recognize one significant change brought about by the educational expansion. The closely-knit largely Anglo-Brahminic elite of the pre-independence era has now been replaced by a somewhat wider elite which includes more affluent sections of our rural society.

However, it is also quite clear that despite this wider coverage of the education system vast masses of our population have so far remained untouched.

Some of the significant achievements and major changes affected by last two decades' planning may now be summed up. While there has been a long shadow between plans and performance, there have been basic changes in our economy and in the social structure which have been brought about by planning. New production relationships have emerged coupled with the emergence of new skills and new focal points of power. There is also no doubt that the Indian economy today has a structural composition which can in principle lead to better performance in the future. In spite of this, if our survey indicates that Indian planning has met with only limited success, it is necessary to discover the reasons for it. There are two possible inferences that can be drawn. One is that Indian planners have been unrealistic in setting the targets and the other

is that Indian planners have not been able to devise a set of instruments which would be adequate to meet these targets. These two explanations are by no means exclusive. In fact, it may be more reasonable to argue that deficiencies of the Indian planning process have arisen from the joint operation of both these factors. It would, however, appear that the deficiencies would appear to be more due to the failure to develop appropriate instruments than to the inherent infeasibility of the targets.

On the side of target setting, Indian planning has suffered from two basic defects. Given the multiplicity of objectives, there has been no clear ranking of these objectives, which has resulted in somewhat contradictory set of policies being attempted at least on occasions during the planning period. As a result, concessions and compromises have been made without any compensatory advantages. Moreover, there has been frequent failure to distinguish between targets and instruments within a given context of decision-making.

As regards the choice of instruments, Indian planning seems to have largely relied on certain financial allocations sector-wise, fortified by a mass of administrative decisions. These are fairly blunt instruments if one would consider the nature of the job that was being attempted. Certain studies dealing with the magnitudes of low-end poverty in the country have helped us to realize how inadequate our instruments have been when it came to having any impact on the conditions of living of the people. Some people have drawn the conclusion from these studies that the investment allocations ratios adopted in the course of the different Plans have been basically misconceived. This does not seem to be the case. What appears to be the position is that for carrying out adequate planning in a mixed economy we have hardly developed mechanisms to influence the production and distribution decisions within the private sector so that they conform to the national priorities. This failure is very serious considering the crucial role the private sector plays in the national economy.

The failure of the planners to devise appropriate instruments may be ascribed to their inability to identify the levers of change in terms of an appropriate set of institutions. Given the nature and magnitude of the job that has been attempted, it is rather remarkable to observe the very cursory analysis that Indian planners and policy makers have carried out in appraising the suitability of alternative institutional arrangements. This would be true whether one talks of education or fiscal policy or the management of public enterprises.

#### IV. The Prospects

**The Fifth Five-Year Plan, 1974-79 :** Our analysis in the preceding sections has shown that despite some growth and considerable diversification

in the structure of production, living standards have not risen commensurately. Part of the explanation no doubt lies in the acceleration of population growth. But in part this has been due to the adoption of the aggregative approach in terms of growth rates. The Draft Fifth Plan has tried to evolve a somewhat more disaggregative approach by proposing a simultaneous attack on under-development and inequality. The latter aspect is as important as the first one as the perspective Plan contained in the Fourth Plan document made quite clear. It was estimated at that time that if gross national product during the Fourth Plan grew at a compound rate of 5.5 per cent followed by a compound rate of growth of 6.2 per cent over the period 1974-75 to 1980-81, the per capita consumption of the second poorest decile of the population would rise to Rs. 27 per month (at 1968-69 prices) by the end of the period. Thus even a fairly high rate of growth sustained over a dozen years would not lift this section above what was described by an earlier committee as the "poverty line". It would, therefore, follow that if poverty is to be removed in any significant way, measures promoting equality have to be undertaken and intermeshed with the growth process itself.

On the growth side, emphasis has been laid on a step up in the rate of growth of agricultural production, in power generation, and in production of steel and non-ferrous metals. Mass consumer goods industries have been envisaged to expand with a view to securing a better balance between demand and supply. To promote self-reliance in the energy sector, a very sharp increase in the level of coal production has been envisaged.

On the distribution side, a three-pronged attack has been contemplated involving the generation of incomes, accrual of incomes and the channelization of a mobilized part of additional incomes into savings, more especially into public savings. From the point of view of generation of incomes, it is quite clear that no substantial improvement in the level of living of the poorest 30 per cent of the population is possible unless the strategy for increasing agricultural production is so conceived as to benefit the small farmers and agricultural labourers.

Specific schemes have been worked out in the agriculture plans to bring about the desired increase in the income levels. These include schemes for drought prone areas, schemes for development of animal husbandry and fisheries, schemes for sericulture and schemes for small farmers and marginal farmers which would help in substantially increasing the income levels of 26 million households in rural areas. All these schemes emphasize the fact that without an increase in the production base of small and marginal farmers, it is not possible to increase their income. Accordingly, these schemes are not to be viewed as so many programmes of social welfare but should be viewed as an integrated attempt to increase the volume and the share of output of these categories of population

through planned provision of necessary credit infrastructure and other organizational facilities.

Land reforms can help the cause of income distribution to great extent not merely through improving the share of the cultivators in total produce but also through increasing the total produce itself. For this purpose land reforms should be conceived as integral to programmes embracing measures relating to credit flows, marketing of produce and distribution of essential inputs. Modern agricultural technology can be adopted regardless of the size of the operational holding and, provided credit and other facilities are made available, a small farmer can be enabled to improve his productivity considerably. Improvement of tenurial conditions is another important instrument leading to both higher output and better distribution of the gains of such output. While efforts have been made in this respect in the past, there is sufficient scope for further action.

Larger employment and income to the poorer sections of the population will not be enough to ensure them a minimum standard of consumption. It will, therefore, be necessary to supplement these programmes by providing social consumption, at least upto a minimum standard, in the form of education, health, nutrition, drinking water, housing, communications and electricity. This is how, then, emerges the rationale of the National Programme for Minimum Needs.

While employment programmes and land reforms are likely to generate a more balanced distribution of incomes by different size classes, fiscal policy assigned an important role in checking concentration of incomes at the accrual stage. In addition, public distribution of essential commodities has been visualized to prevent the possibility that real consumption of the poorer sections can fall as a result of failure of production to come up to the requisite level. Special measures have been contemplated which make savings more attractive on the margin than consumption.

Inflow of net aid has steadily declined during recent years. The objective of self-reliance will be carried a step further during the Fifth Plan by reducing further the economy's dependence on foreign aid. This would be in keeping with the objective of dispensing with gross concessional aid altogether.

The maintenance import requirements of the economy have been steadily increasing over the years. The major items in this regard are fertilizer and fertilizer materials, chemicals, non-ferrous metals, special varieties of steel, components and spare parts of machinery. It is estimated that of the estimated imports during the Fifth Plan period about 80 per cent will be on account of maintenance needs of the economy. Import substitution, thus, becomes a crucial factor in the speedy realization of the goal of self-reliance. It, therefore, becomes of supreme importance that the production targets in agriculture and mineral and industrial sectors are achieved according to schedule. Non-essential imports must be cut down

to the minimum.

By developing domestic production, it may be possible to altogether avoid imports in some cases, such as, most categories of mild steel, nitrogenous and phosphatic finished fertilizers and many items of plant and equipment and reduce and restrain them in other cases like non-ferrous metals. There would also be cases where the requirements can be met by domestically produced substitutes, as for example, coal and hydro-power may be substituted for imported liquid fuels and aluminium for imported copper. Restructuring of the energy base of the economy has become extremely urgent in view of the energy crisis. All opportunities, for economy, and import substitution must be availed of if the balance of payment problem is to be kept manageable. This would be a major thrust of policy during the coming decade.

Given the size and diversity of our resource endowment, import substitution and export promotion can be regarded as complementary objectives. In fact, certain major areas, such as steel and aluminium are prime examples of the complementary nature of these two objectives. It makes considerable economic sense to argue that India should concentrate its efforts on exporting finished steel rather than iron ore. In fact, in the growth profile of the Fifth Plan as well as in the perspective Plan such a possibility has been visualized.

The import substitution contemplated in the Fifth Plan is selective and not indiscriminate. In the past, the cost of domestic manufacture has sometimes been inordinately high compared to the landed cost of similar items. In such cases, import substitution may lose much of its significance, if the cost level cannot be brought down quickly. In the Fifth Plan, the main thrust for import substitution has to be in the fields in which the country is favourably placed for production at reasonable cost. In the past, in several cases, an industry initially nurtured through the policy of import substitution, has in due course acquired a level of efficiency that enabled it to grow into an export industry. Import substitution policies for the Fifth Plan will have this perspective. This means that cost and quality must be given as much attention as the quantity of production.

It has been found that a lower rate of growth does not involve commensurate relief on the balance of payments account. This is because the impact of a lower rate of growth falls more than proportionately on certain basic industries when the degree of manoeuvrability on the balance of payments front is very limited because of the heavy debt service obligations and the needs for maintenance imports which are crucial for the economy. Import substitution through fuller utilization of existing capacities and creation of necessary capacities therefore assumes great importance.

While import substitution is going to remain an essential ingredient of

our policy, it is quite clear in view of the increased costs of liquid fuels and other essential inputs such as fertilizers, export promotion must be given a very prominent place in the strategy for self-reliance.

What is urgently called for is a comprehensive review of export policies and potential so as to impart the necessary dynamism to our export effort. Industries producing luxury goods constitute sizeable constraints on our foreign exchange and domestic resources. However, the existing capacities in these industries cannot be scrapped without causing unemployment at least during the transition period. Effort, therefore, must be made to utilize them for export purposes as far as possible.

The rate and pattern of growth for the Fifth Plan follows from the objectives and strategy of the Plan. After trying out several variants, the Planning Commission has adopted the one providing for a 5.5 per cent average annual rate of growth. The composition of growth has been worked out on the supply side by postulating a reduction in the inequality of consumption. The extent to which the reduced inequality level will be realized depends not only on our ability to produce the needed quantities on the margin but also, as mentioned earlier, in generating additional incomes in the hands of the poorer sections of the community.

The Plan takes note of some special problems and makes provision to tackle them. The backward and hill areas present in essence a problem in area development and call for an area approach. It will be our effort in the Fifth Plan to formulate integrated development programmes for these areas. The National Programme for Minimum Needs will have to be integrated with the overall programme. Institutional arrangements for integrated development programmes for backward areas as well as their mode of financing are being worked out. Since the primary responsibility for developing the backward areas lies with the States, they are taking steps to strengthen the machinery required for undertaking this responsibility.

The Fifth Plan will seek to intensify the efforts for the development of the backward classes. It will lay emphasis on the role of the "general sector" in providing major development programmes for these classes. Priority will be accorded to these classes in the implementation of the National Programme for Minimum Needs. The Plan will provide for integrated child care services to the most needy families. There will also be programmes to improve the competitive capability of talented students. The working and living conditions of those engaged in unclean occupations would receive priority. Areas with concentration of tribal population will receive special attention.

There is need to attain and maintain a reasonable balance as between wages, prices and incomes. With this in view, the scheme of financing seems to avoid generating excess demand. The provision for deficit financing would be restricted to a level only where money supply would

not exceed the requirements of the economy arising from growth in real terms. As mentioned already, an adequate public procurement and distribution system for assured supplies of essential consumption goods, at least for the poorer sections, at reasonably stable prices is envisaged.

A sensitive area in regard to the problem of stabilization of prices is the one relating to agricultural production, particularly food. It has been our experience in the past that even a marginal surplus or deficit may make all the difference between adequacy and scarcity. The reasons for this are not far to seek. Nearly 60 per cent of total household consumption and 85 per cent of the commodity consumption of households is comprised of agricultural products or manufactures based on agricultural raw materials. Data from the N.S.S. suggest that the overall elasticity of demand for food products is quite high. The prospect of achieving the projected growth in incomes under conditions of stability is almost entirely the function of the prospects of growth of agricultural production and the skillful management of the available surpluses.

While agriculture has enjoyed a high priority in our Plans, the importance and need of continued emphasis on agriculture in the coming years is only too obvious. In the meanwhile, however, the problem of management of food and other agricultural surpluses becomes extremely important. We must build up effective procurement and distribution system for the foodgrains. It will be necessary to give adequate attention to the difficulties of feeding the distribution system even in a lean year.

It will be necessary to ensure that rises in wages, unrelated to improvement in productivity, will not be allowed. It will be necessary to evolve an equitable national wage structure covering the public and private sectors. It will be necessary to enforce proper discipline on those who draw their income from property and enterprises, particularly with a view to checking conspicuous and inessential consumption. The prices-wages-income policy has to be viewed as a consistent whole.

Indian planners have recognized from the beginning that science and technology have a major role to play in the transformation of the economy. Development is a process of utilizing more and more effectively resources of the community in the achievement of the socio-economic objectives. These resources are partly given by nature, but they have to be transformed by the application of new skills and technical know-how. In a sense these skills and know-how are more important than even capital formation proper. A continuous and progressive increase in the conditions of living of the people presupposes not only more effective utilization of known resources and better application of known techniques, but it also calls for increasing search for discovery of new resources and adoption or development of new productive techniques.

Some economists, notably Kuznets, have maintained that the most important single factor contributing to economic development is the

community's readiness to develop and apply modern technology to processes of production. Advances in this field are taking place rapidly and they are of direct significance not only to the organization of production, transport and other economic activities but also to the wider issues relating to economic and social organization. Under-employment is from one point of view a consequence of insufficient technological progress and adaptation. Countries which start late in industrial development have this advantage in that they have to tap, so to say, the technology already developed in the advanced countries, but there is need for keeping abreast of the latest developments and for continuous innovation to adapt the technology to the needs and conditions of developing countries of today.

Investment in scientific research, therefore, becomes an important prerequisite for ensuring speedy development. That is why the successive Five Year Plans made steadily increasing allotments for scientific research and development of technology. Through improvement in agriculture, medical and health facilities, techniques of locating and processing raw materials, providing substitutes and evolving new materials, appliances and techniques for industry, transport, power communications and other essential utilities, investment in research yields a return many times more. This has been abundantly proved by the results of research in high yielding varieties of crops. It will be only through a technological breakthrough in rice production and techniques of dry farming that a real agricultural revolution can be achieved in the Indian economy.

In the context of the urgency to achieve the objectives of self-reliance and social justice, the need for rapid strides in science and technology is only too obvious. Although scientific research has been a part of national planning during the last two decades, the efforts so far have been rather limited. The goals of Research & Development programmes and projects have often not been derived directly from the technological needs of development projects. At the same time, the scope of science planning has not covered the whole of the 'innovation chain'. As a result, successful research results at the laboratory level have often failed to be linked to such elements as pilot plant work, design engineering, plant erection and commissioning and marketing which are essential if a nation is to secure real and substantial benefits from science and technology.

It is for this reason that in the Fifth Plan for the first time a comprehensive science and technology plan covering the entire economy has been prepared as an integral part of the Plan. The National Committee on Science and Technology was set up to undertake the task of formulating the programme content for such a Plan, as also advising Government on the policy framework, organizational and managerial structure and other measures needed for its implementation. The science plan is not a plan merely for education and research but a plan to harness science and

technology for achieving the goals and programmes of the Fifth Plan. The basic objective of the science and technology plan is to support the drive for self-reliance in the core sector of the economy such as, agriculture, energy, mining, metallurgy, heavy engineering and chemicals ; to make further progress in areas such as atomic energy, space and electronics and to contribute to meeting the basic needs of the people such as housing, health and education.

Great stress will be laid on proper and effective implementation of plan programmes and policies. We have to improve the performance of the administrative apparatus, to avoid delays and to cut out waste and to stop leakages. Special attention will have to be given to project formulation. Lack of well formulated projects has been one of the serious handicaps in the fulfilment of the Fourth Plan production targets. There has to be a greater utilization of capacity and urgent steps will have to be taken to correct the persisting imbalances and inter-sectoral distortion in the economy and for better maintenance of plant and equipment. The delays and inefficiency have been found to be due to inadequacies of management and lack of harmony in industrial relations. This is true of both the public and private sectors and their operation calls for marked improvement.

The objectives and strategy for the Fifth Plan call for considerable work towards evolution of a policy-frame for the successful implementation of the development programmes. A detailed policy-frame covering agricultural policy, policy for resource mobilization and for achieving regional balance in development is being worked out.

**The Long-Term Perspective : 1974-86.** The Fifth Plan has been formulated in the background of a long-term perspective extending to 1985-86. The perspective plan envisages a rate of growth of 5.5 per cent in the Fifth Plan, 6 per cent in the Sixth Plan and 6.2 per cent in the first two years of the Seventh Plan. The sectoral rates of growth have been worked out keeping in view, the priorities of sectoral outputs in final demand and the feasibility of domestic production at economical costs which in turn depend upon resources endowment and the market conditions. As a result of the differential sectoral growth rates, there would be a structural change, even if on a modest scale. The share of mining and manufacturing in the gross domestic product is expected to improve from 15.39 per cent in 1973-74 to 19.98 per cent in 1985-86; of electricity from 1.13 per cent to 1.79 per cent; of construction, from 5.62 per cent to 7.75 per cent; of transport from 4.42 per cent to 4.56 per cent, and of services, from 27.70 per cent to 30.39 per cent. As it should happen in the course of development, the share of agriculture and allied sectors would decline from 45.76 in 1973-74 to 35.73 per cent in 1985-86. This is fully in line with the

experience of the developed countries in comparable stages of the development.

The population growth is one of the most crucial variables influencing the rate of growth in per capita income. On certain assumptions in regard to the success of the family planning programmes which will require substantial organizational efforts in themselves, the total population has been estimated to increase from 547 million in 1971 to 581 million in 1974 and 705 million in 1986. The increase in population in the 12 year perspective period has thus been estimated to go down from 35.57 per thousand during 1971-76 to 29.57 during 1976-81 and further to 24.82 during 1981-86. As a result of the expanding public health programmes and improvement in the standard of living of the people, the death rate is also expected to go down from 15.23 per thousand during 1971-76 to 12.8 during 1976-81 and 11.14 during 1981-86. As a result of the comparatively steep fall in the birth rate, the growth rate of population is, however, expected to decline from 2.03 per cent per annum during the first period to 1.68 during the second and finally to 1.37 per cent in 1981-86.

As a result of the decline in the birth rate, there will be an improvement in the age structure of population. The progressive decline in the share of 0-14 age group from 41.4 per cent of the population in 1971 to 33.3 per cent in 1986 will mean a welcome reduction in the dependency ratio which will have a beneficial impact on the living standards and capacity to save. The age group 5-14 representing the school going children will go down in its share from 25.6 per cent in 1971 to 22.7 per cent in 1986. This is expected to facilitate the achievement of the target of universal, elementary and middle school education. The fall in the rate of growth of population will affect the labour force with a time lag of about 15 years. The higher rate of growth of population during the last 15 years will, therefore, reflect itself in the increased size of labour force during the next 12 years. It is estimated that the participation rate would increase from about 31 per cent in 1971 to 32.6 per cent in 1979, 34.4 per cent in 1984 and the end of the Sixth Plan and 35.2 per cent two years later. The participation rate would, however, still be lower than in the advanced countries. The addition to labour force would thus be 65 million or more than 3½ times the present level of employment in the entire organized sector, both public and private. Considered along with the huge backlog of unemployment and under-employment, providing jobs to the growing labour force is going to present the single most important problems in the years to come.

This makes the problem of removal of poverty particularly difficult as poverty has been the result of unemployment and under-employment on a large scale. As a result of the shortfalls in the growth rates postulated in the Fourth Plan, it has been necessary to lower our sights in the Fifth, Sixth and the Seventh Plan. At the projected rates of growth the object

of removal of poverty can be realized only if there is considerable reduction in the inequalities of consumption. The share of the bottom 30 per cent of the population has been estimated at present at 13.46 per cent of total private consumption. If this share remains unchanged, the average per capita consumption of this section would rise from Rs. 25 per month (at 1972 prices) in 1973-74 to Rs. 29 in 1978-79 to Rs. 35 in 1983-84 and to Rs. 38 in 1985-86. Thus even by the middle of the Seventh Plan per capita consumption of the poorest 30 per cent would be below the minimum desirable level of consumption of Rs. 40.6 per month at 1972-73 prices. Such a state of affairs cannot, of course, be tolerated. The Fifth Plan exercises show that if the private consumption norm in respect of the poorest 30 per cent has to be met by 1978-79, their share in total private consumption will have to be raised from the present 13.46 per cent to 18.85 per cent. If, on the other hand, the objective has to be reached by 1983-84, that is the end of the Sixth Plan, their share will have to go up to 15.64 per cent and, if the deadline is extended to 1985-86, there will have to be only a marginal upward change to 14.44 per cent. This gives an idea of the order of redistributive effort that is required for achievement of the goal of removal of poverty. The growth strategy in our perspective must, therefore, mean not only a higher rate of growth than in the past but also progressive redistribution of incomes and consumption. It will not only be the rate but also the content of growth that will be crucial in this connection as has been already mentioned. The pattern of production must lay emphasis on articles of mass consumption. There will have to be employment creation on a fairly increased scale. It will also be necessary to increase social consumption and investment with a view to maximizing the efficiency and productivity of vast numbers to improve the quality of their lives. The institutional reform and the fiscal policy must be oriented to reduce the inequality along with increased productivity. The backward regions and classes have a higher incidence of poverty. Their development must receive priority.

Keeping the above consideration and the inherent constraints in view the perspective of development for the next 12 years provides for a structure of production consistent with the emerging requirements. The basic objectives of self-reliance and removal of poverty call for restructuring of output in favour of goods and services that go into investment, exports and essential private and public consumption or serve as crucial intermediate inputs for final production. This will be clear from Table V which sets out the selected output projections for the period 1973-74 to 1985-86.

**TABLE V.**  
**Selected Output Projections.**

| <i>Item</i><br>(1)                                            | <i>Units</i><br>(2) | <i>1973-74</i><br>(3) | <i>1978-79</i><br>(4) | <i>1983-84</i><br>(5) | <i>1985-86</i><br>(6) |
|---------------------------------------------------------------|---------------------|-----------------------|-----------------------|-----------------------|-----------------------|
| 1. Foodgrains                                                 | million tonnes      | 114                   | 140                   | 162                   | 170                   |
| 2. Coal                                                       | mill. tonnes        | 79                    | 135                   | 203                   | 238                   |
| 3. Iron ore                                                   | mill. tonnes        | 37                    | 58                    | 75                    | 83                    |
| 4. Crude petroleum                                            | mill. tonnes        | 7.7                   | 12                    | 15                    | 15.5                  |
| 5. Sugar                                                      | mill. tonnes        | 4.3                   | 5.7                   | 7.4                   | 8.2                   |
| 6. Cotton cloth                                               | mill. metres        | 7800                  | 10000                 | 12750                 | 14100                 |
| 7. Petroleum products                                         | mill. tonnes        | 21.5                  | 34.6                  | 48.0                  | 55.2                  |
| 8. Nitrogenous<br>fertilizers (N)                             | '000 tonnes         | 1162                  | 4000                  | 6300                  | 7000                  |
| 9. Phosphatic fertilizers<br>(P <sub>2</sub> O <sub>5</sub> ) | '000 tonnes         | 350                   | 1250                  | 2600                  | 3000                  |
| 10. Sulphuric acid                                            | '000 tonnes         | 1400                  | 3200                  | 7800                  | 9500                  |
| 11. Caustic soda                                              | '000 tonnes         | 450                   | 785                   | 1250                  | 1500                  |
| 12. Soda ash                                                  | '000 tonnes         | 500                   | 880                   | 1350                  | 1650                  |
| 13. Drugs and pharma-<br>ceuticals                            | Rs. crores          | 300                   | 500                   | 800                   | 950                   |
| 14. Cement                                                    | mill. tonnes        | 16                    | 25                    | 38                    | 44.7                  |
| 15. Mild steel (finished)                                     | mill. tonnes        | 5.44                  | 9.4                   | 17.1                  | 20.5                  |
| 16. Aluminium                                                 | '000 tonnes         | 190                   | 370                   | 600                   | 740                   |
| 17. Copper                                                    | '000 tonnes         | 18                    | 45                    | 90                    | 95                    |
| 18. Agricultural tractors                                     | '000 nos.           | 40                    | 80                    | 110                   | 140                   |
| 19. Machine tools                                             | Rs. crores          | 65                    | 137                   | 230                   | 271                   |
| 20. Hydro turbines                                            | mill. kw.           | 0.53                  | 1.4                   | 2.0                   | 2.3                   |
| 21. Thermal turbines                                          | mill. kw.           | 1.7                   | 2.2                   | 3.0                   | 3.2                   |
| 22. Power boilers                                             | mill. kw.           | 1.1                   | 2.5                   | 3.0                   | 3.2                   |
| 23. Electric transformers                                     | mill. kva.          | 12.5                  | 20                    | 35                    | 40                    |
| 24. Electric motors                                           | mill. H.P.          | 3.6                   | 5.8                   | 9.5                   | 11.5                  |
| 25. Electricity generation                                    | GWH                 | 72                    | 120                   | 200                   | 245                   |

The projections beyond 1978-79 are in their very nature much more tentative and would undergo revision and improvement as more data become available and further studies are undertaken. But as long as the basic objectives of development remain the same, it is unlikely that there will be any significant change in the broad profile of the sectoral growth indicated in the Fifth Plan perspective.

It will be necessary to ensure that the structure of demand harmonizes with the pattern of output envisaged in the perspective. The structure of demand will have to change keeping in view the need of rapid growth,

reduced inequality and progressive self-reliance. In other words, it will have to change in favour of investment and social consumption and in the direction of reduction in dependence on foreign aid. This implies a progressive decline in the share of private consumption. It is projected that private consumption as a percentage of gross national expenditure would decline from 75.9 per cent in 1973-74 to 67.5 per cent in 1985-86. Public consumption will go up marginally from 11.9 per cent to 12.5 per cent over the same period. Capital formation is, however, estimated to rise from 13.7 per cent to 19.7 per cent. As the rate of capital formation approaches 20 per cent, the economy will be in a position to sustain a rate of growth of 6.5 per cent per annum, thus, doubling its G.N.P. every 11 years.

The improvement in the rate of capital formation will be accompanied by progressive reduction of inflow of external assistance. Gross foreign aid is estimated to decline from Rs. 783 crores in 1978-79 to Rs. 100 crores in 1983-84 and altogether disappear in 1985-86. This would call for a vigorous and sustained export drive. With its enormous reserves of high grade iron, the country has a good potential for production and export of iron and steel. Among the non-ferrous metals, aluminium has substantial export potential. Engineering goods is another area with a very large export potential. In recent years there has been a rapid expansion in the export of pearls and precious stones, jewellery and handicrafts. We have great advantage of skill and abundant manpower in this field. We have also great potential in marine products. The varied resource endowment of the country and the size of the internal market make it possible to produce economically a large number of items which will effect substantial import substitution. The object of self-reliance requires that all such opportunities for import substitution are exploited. This would be a major thrust of policy during the next two Plans.

The growth in public consumption is needed and justified in view of the need for further expansion of social services. It is also envisaged that the growing public consumption and investment will have to be supported by progressive expansion of public savings. The policy of reliance on public savings has a sound logic. Public savings is not only very necessary but also a very desirable means of stepping up domestic savings. If the resources at the disposal of the Government can be increased by reducing the disposable incomes of the well-to-do, this will be very desirable in itself. Moreover, higher private savings means higher capital formation by the better off sections of the people and this would lead to further inequality of incomes and wealth. Increasing savings in the hands of the public authorities would also facilitate their direct investment into socially desirable channels. Thus increasing public savings would be an effective instrument of securing growth with social justice.

The projected improvement in the rate of savings implies a marginal

rate of saving of over 26 per cent in the Fifth Plan and about 28 per cent thereafter. For the entire perspective period, the marginal rate of saving works to 27.3 per cent. This is doubtless a rate which exceeds our past record in this area but given the proper political will, it is not beyond the capacity of the economy to achieve.

Thus, at the end of the perspective period, there will be a distinct progress in the realization of our basic objectives of removal of poverty and self-reliance. But, as postulated above, realization of the above perspective depends upon a number of conditions being fulfilled. The rate of savings and investment in the economy must be substantially raised and a growing proportion of this will have to be channeled into the public sector. This constitutes a serious challenge in as much as the rate of savings and capital formation in the economy as a whole and particularly in the public sector has been not only stagnant but decelerating. The production targets must be achieved as scheduled. Or else, the disproportionalities between the changing requirements of the society and the emerging pattern of production will get further accentuated, defeating the twin purpose of reducing inequality and attaining self-reliance through import substitution and export promotion. Population growth is another crucial parameter in the growth process and its control depends very much on the success of the family planning programmes which are being envisaged.

To sum up, one may say that the tasks outlined in the perspective plan for development are not merely very urgent but also quite formidable. Yet it must be clearly understood that we are engaged in a race against time. Any delay in getting over the basic disproportionalities in the economy which have arisen largely from inadequate development in sectors such as food and fuel will compound our difficulties further. This is all the more true because of the rapid increase in population levels which has been experienced in the past. Partly as a result of "demographic inertia" and partly because of continued population growth at fairly substantial rates though on a gradually diminishing basis, the land-man ratio is getting increasingly unfavourable. If this growing demographic pressure is not counteracted by an increase in capital stock per head as well as in energy consumption per capita, we are likely to remain caught in a low level equilibrium trap. It should also be borne in mind that this low-level equilibrium is not a stable configuration either. Hence, danger of slippage is a very great.

To carry out the structural changes in the economy, far-reaching changes in the social sphere will be needed. There are a very large number of complex issues involved. But changes in attitudes as well as in methods of economic organization are going to prove very crucial if India has to develop an egalitarian economy accompanied by progressively higher levels of social and economic welfare.

## ANNEXURE

## Selected Output Target/Projections and Achievements

## **EPILOGUE**

In the foregoing chapters an exhaustive account has been given of different sectors of the economy and different aspects of activity in each sector. These chapters have dealt in each case with historical trends of the past, the present status, and also future prospects. We have, thus, had a view of each aspect or sector considered separately. In the course of this discussion we have had an adequate idea of the inter-relationships of each aspect or sector of the economy with closely related aspects and sectors. Even so, it should be useful to compose these parts into a whole for a broad overall perspective of the status, the state, and the prospects of the Indian economy. We propose, thus, to focus attention on the overall position of the Indian economy as it is today. We would not, therefore, unduly dilate upon the current problems which are of transitory nature. We attempt here to take stock of the basic strength and the weaknesses of the economy as an on-going and functioning entity. In doing so, we first consider the present status of the Indian economy by directing attention to its comparative position among the countries of the world. Next, we consider the stage of the economy reached today in the course of its evolution since independence. Thereafter, we proceed to examine the nature of development effort that has been going on since then, directing attention to the strategies that have been evolved to nurse this process. We finally indicate the course which the economy is likely to pursue in future, thanks to the direction that is being given through centralized planning.

Let us first identify the economy in terms of its extent, its size and broad structure. The economy must be considered as co-extensive with the nation, or the country, as a whole. Its geographical extent is nearly 3.3 million sq. kilometres inhabited at present by some 600 million people. Within the populous vastness of the economy, there no doubt obtains considerable diversity of resource endowment and in socio-cultural milieu. The economic activity of this mass of people yields an annual per capita income of around Rs. 600 (at current prices). The

distribution of the income, however, is very skewed and a substantial proportion of the population live, in abject poverty, in dire want of basic necessities of life. The second interesting feature which should be mentioned here is that more than two-thirds of the population depend on agriculture for their livelihood. This predominance of agriculture is also reflected in the composition of what has been called the gross domestic product, which represents the aggregate outcome of the economic activity of the population as a whole. Agriculture accounts for nearly half of this aggregate; industry, including mining and construction, for about one-fifth; trade and commerce for about one-tenth; and services, including both public and private, for the remaining about one-fifth. This nature of composition of the gross domestic product reflects the large scope for development effort which remains to be undertaken in this economy which has been developing for over two decades now at a significantly higher pace than before. The effort of these decades represents in effect only the first steps on the path of development leading to the emergence of a viable modern economic structure based on 'optimum' utilization of our resource endowments.

# I

For an idea of the present status of the Indian economy in the world context we must confine attention to selected variables indicating the size of the economy. The variable which we have chosen for this comparison are area, population and national income or gross national product. We will also refer to per capita national income and the composition of gross domestic product for indicating differences in the character of economic activity among these countries.

For the purpose of this comparison, it is not necessary to consider the entire list of over 200 countries for which the United Nations compiles statistics in their annual publications. We have taken from this list all countries which have a population of more than 10 million. Applying this criteria, we get a list of 51 countries.\* It may be noted, however, that taken together these 51 countries account for nearly nine-tenths of the world's population.

In terms of area, India is the seventh largest country in the world. The largest country is, of course, the U.S.S.R. which occupies about one-sixth of the aggregate area of all nations of the world. India accounts for only around 0.5 per cent of the world aggregate. The geographical extent of our country is less than a tenth of that of U.S.S.R. and about one-third of that of Canada, China or U.S.A. Among the countries occupying positions adjacent to India in this order, Brazil extends over

---

\*All data for international comparison are taken from the latest *United Nations' Statistical Year Book, 1973* : Tables 18, 143, 178 and 182.

8.5 million, Australia over 7.7 million, and Afghanistan over 2.8 million sq. kilometres, as compared to 3.3 sq. kilometres of India. The smallest amongst these 51 countries is the Netherlands spread over only 41,000 sq. kilometres, which measures just over 1 per cent of the Indian areal extent. Similar is the comparative position of India with reference to the neighbouring Sri Lanka, which is almost as small as the Netherlands.

In population, India occupies the second position in the world, preceded in that order only by China. It is also notable that the U.S.S.R. with third position in the order, has a population measuring only 40 per cent of that of India. The U.S.A. with around 210 million people closely follows U.S.S.R. in that order. It is striking that each of the countries with a larger geographical extent has a much smaller population than India, with the only exception of China. It must be mentioned, however, that the difference between India and China is much greater in area than in population, with the result that in terms of density China is much lower down in the scale; China has 83 persons per sq. kilometre as against 172 persons per sq. kilometre in India. Among the 10 largest countries of the world we have also Indonesia, Japan, Brazil, West Germany, Nigeria, Bangla Desh, and Pakistan. As compared to the first three of these countries India's population is more than 5 times as large, while when compared to the latter four it is around 10 times as large.

Ignoring the differences in the level of development, we may compare these countries in terms of population density representing a very crude measure of the relative pressure of population on land. In the descending order arranging these countries according to density, Bangla Desh evidently occupies the top position; from the available figures for 1963 it is shown that Bangla Desh then had a density of around 370 persons per sq. kilometre. Notable among the countries with densities much higher than India are the Netherlands, South Korea, United Kingdom, Sri Lanka and Italy. India occupies the ninth position in this order with a density of about a half of that of Bangla Desh, South Korea or the Netherlands. Leaving aside the countries in the North and Latin America, Middle East and Africa, where densities are very low, it is notable that India's density is much higher even as compared to some of the European countries like Czechoslovakia, France, Hungary, Poland, Romania, Spain and Yugoslavia.

With regard to gross national products (G.N.P.) we do not have figures for several of these countries, including Argentina, China and U.S.S.R. Arranging the remaining 38 countries, India is found to occupy the eighth place among them. This order is led by the U.S.A. whose G.N.P. is 23 times as large as that of India. Canada precedes India in this order in the seventh place with a G.N.P. as much as twice that of India. Spain follows India in the ninth place with a G.N.P. smaller than that of India by only about 8 per cent. The smallest G.N.P. amongst these countries, that of Nepal, is

only a fraction of that of India.

An interesting feature of India's position in the world is that while manufacturing activity accounts for a comparatively much smaller proportion of the G.N.P. as will be shown later, in absolute terms manufacturing output of India is larger than that of most countries of the world barring some of the leading industrial countries like the U.S.A., Japan, the U.K., West Germany and France. This comparative position is reflected in manufacturing employment in the organized sector which is around five million in India. This measures less than a third of the corresponding figure of the U.S.A., less than a half of that in Japan and much less than three-fourth of that of Germany or the U.K. But it is comparatively much larger than that of other countries like Poland, Italy, East Germany, Spain, Brazil, Argentina and Canada. India can be included in effect amongst the leading producers of manufactured goods.

It seems clear thus that the Indian economy commands a position of relative importance in the world in terms of its geographical extent, its population, size, its gross national product, and the size of its manpower engaged in organized manufacturing sector.

But once we turn to per capita national income, the position is drastically reversed. The per capita income of India amounts to only about 90 dollars per annum. Among the 39 countries for which the requisite comparable data are available, India occupies thirty-fifth position. It takes precedence, by a sizable margin, over Nepal, Ethiopia, Afghanistan and Nigeria. It is in turn preceded, by a small margin, by such countries as Zaire, Tanzania, Sudan, Indonesia, and by a significantly larger margin by Uganda, Sri Lanka, Kenya, Thailand, South Vietnam and Egypt. At the other end of the scale we have the well-known prosperous nations of the world, including Australia, Canada, West Germany, France, Japan, the Netherlands, the U.K. and the U.S.A. The Indian per capita national income of around 20 dollars per annum measures 1.8 per cent of that of the U.S.A., 2.1 per cent of that of Canada, 2.4 per cent of that of West Germany, 2.6 per cent of that of France, 2.8 per cent of that of the Netherlands, 3.1 per cent of that of Australia, 3.5 per cent of that of the U.K., and 3.6 per cent of that of Japan. This comparison is not adequate as corresponding figures of major countries like U.S.S.R. and China are not available. Even so, all available indications suggest that the Indian per capita national income is below that of China and very much lower than that of the U.S.S.R.

The indication of the great extent of relative under-development of the Indian economy provided by comparative meagreness of its per capita national income is equally reflected in the structure of its economic activity. The share of agriculture in gross domestic product in the case of India is 45 per cent. This compares favourably with the corresponding figures for a few of the other under-developed countries. This proper-

tion is higher than in India only in Uganda, Ethiopia and Nepal. In contrast it is much lower in most of the so-called developed countries. Agriculture accounts for only 3 per cent of the G.N.P. in the U.S.A., the U.K. and West Germany, 4 per cent in Canada, 6 per cent in Australia, France and Japan, and 7 per cent in the Netherlands and Venezuela.

If we consider in contrast the proportion of G.N.P. derived from manufacturing, mining and construction activities, India's position is sharply different. Only 19 per cent of our G.N.P. is derived from such manufacturing activity. This proportion is a little higher than the corresponding proportions shown by Tanzania, Uganda, Sudan, Sri Lanka, Nepal, Kenya and Ethiopia. The corresponding proportion of several other countries are very large. The share of this sector in G.N.P. is 32 per cent in Canada, 34 per cent in the U.S.A., 35 per cent in Argentina, 37 per cent in the U.K. and 41 per cent in Japan. It is even higher for several countries of Eastern Europe; here it measures 62 per cent of the G.N.P. in Poland, 63 per cent in the U.S.S.R. and 73 per cent in Czechoslovakia.

We may also refer to the relative position of the Indian economy in the world market. For this purpose, we will refer separately to its position in the export market for commodities and the corresponding import market. Here again our comparison is limited to countries for which relevant data are available from United Nations' sources. According to these statistics, India does not figure among the leading countries in either of these markets. The value of either exports or imports measures only about 5 per cent of the G.N.P. The ratio of the aggregate value of foreign commodity trade (exports plus imports) to G.N.P. is very much smaller for India when compared to most countries of the world. This ratio amounts to 10 per cent for India and also the U.S.A. It represents a small fraction of the corresponding ratios for industrialized countries like West Germany, France, the United Kingdom, Japan and also Canada on the one hand, and of the corresponding values of the developing countries like Iran, Iraq, Morocco, Nigeria, Tanzania, Venezuela and Zaire, on the other.

Arranging these countries in a descending order of importance according to the value of annual exports, we find India placed at almost the end of the order. The value of its annual commodity exports measures less than 5 per cent of that of the U.S.A. or West Germany, and less than 7 per cent of that of Japan, France or the U.K. The comparative position of India as an importer is similar. On the whole, it is clear that this large economy of ours commands little importance in the international trade.

The comparatively low level of development of the Indian economy is even more strikingly reflected in the level of consumption of certain key commodities. From a large list of these consumption items, we need refer in per capita terms to only three selected ones, namely, energy and steel, reflecting the degree of industrialization and sugar, reflecting the level of people's living. Among the 51 countries of our list, India

occupies thirty-seventh position in the descending order of per capita energy consumption. Our annual consumption of all types of energy amounts to only 186 kilograms of coal equivalent. This is somewhat larger than the corresponding amount of Kenya, Pakistan, Sri Lanka, North Vietnam, Indonesia or Sudan, and very much larger than that of Zaire, Tanzania, Uganda, Nigeria, Afghanistan, Ethiopia or Nepal. Even so, it represents only a small fraction of the corresponding amounts of the countries at the top of the order. Our per capita energy consumption measures only 1.6 per cent of that of the U.S.A., 1.8 per cent of that of Canada, 3.1 per cent of that of Czechoslovakia and between 4 to 5 per cent of that of the Netherlands, Australia, the United Kingdom, West Germany, the U.S.S.R., Poland, France or Japan.

Our per capita consumption of steel is about 16 kilograms per annum. Our comparative position in the order is about the same, the same countries taking here precedence over us as in respect of the consumption of energy. Our lead over Kenya here is marginal, but it is substantial when compared to several other countries including Pakistan, Indonesia and Sri Lanka. The insignificance of our per capita steel consumption is again indicated by the fact that it measures only around 2.5 per cent of that of the U.S.A., Czechoslovakia, West Germany, Japan or Australia. Thus, while we may claim some importance in the industrial world on the basis of the size of employment in organized manufacturing activity, the level or degree of our industrialization is shown to be of little significance in terms of per capita consumption of basic items of energy and steel.

Similar is the comparative position of our level of living as shown by our per capita consumption of sugar. It amounts to only 7 kilograms per annum and this is amongst the lowest in the world. Among the forty countries of our list for which comparable figures are available, our consumption is higher than that of only China and North Korea. The highest sugar consumption, recorded here for the U.K., amounts to 52.3 kilograms. It is followed by 50.3 kilograms of the U.S.A., 47.0 kilograms of Canada, 46.4 kilograms of Australia and 44.2 kilograms of Hungary. Included among the other countries whose annual per capita sugar consumption is five times or more than that of India are Poland, Czechoslovakia, Argentina, the U.S.S.R., Venezuela, Brazil, East Germany, South Africa and Mexico.

Thus, we may conclude that the Indian economy in terms of both area and population is one of the largest in size among the economies of the world but it is nonetheless one of the most under-developed among them as shown by the level of its per capita national income and by per capita consumption of key items like energy, steel and sugar or by the relative preponderance of primary, particularly the agricultural activity in the structure of its production.

## II.

Today, the Indian economy is decidedly on the march. For a better appreciation of its new dynamism it is necessary to recall briefly the historical context in which the process of infusing it into the economy was launched soon after independence. In the course of history stretching back over about two hundred years from that date, the western nations had achieved, through industrial revolution and technological progress, their transformation into highly developed modern economies of affluence. During the same period, it was India's lot to endure colonial status within the British Empire and subserve interests other than her own. The lifting of the British rule in 1947 removed at one stretch the basic all-pervasive constraint on our potential for economic growth. It was, however, accompanied by the partition of the country which disrupted beyond repair the economic structure that had emerged during the era of British imperialism in India.

That era was one of economic transition induced by our contact with the West. The first phase of this long drawn out process of transition lasted up to the middle of the nineteenth century. Its focus was on external commerce which grew rapidly on account of the discovery of new sea routes and progress of maritime transportation. It was, at the same time, a period in which the British virtually eliminated the rival colonial powers, the French and the Portuguese, and progressively extended their political rule and influence over the entire sub-continent. Those who came to trade with us became thus our rulers.

The next was the phase of consolidation of the colonial rule. It extended upto the First World War. In the course of this period, a viable administrative, judicial and fiscal superstructure was imposed all over the country for achieving a semblance of political unification and for preserving law and order. Internal peace and security were apparently maintained all through this period.

The prime motivation of the rulers then was to render utmost help to the progress of their country towards industrial supremacy in the world. This was eminently fulfilled by operating a set of colonial policies which, on the one hand, invoked *laissez faire* in a manner involving not merely neglect of indigenous needs and interests but also a large scale decay and destruction of native crafts, skills and enterprise and, on the other, vigorous promotion of British capital, know-how and enterprise in the opening up of the country through an extensive network of railways and roads, and the 'mining' of the colony through trade, commerce and finance. British capital established the tea and coffee plantations and the jute industry to supply the needs of their expanding empire and also pre-empted a sizable part of the growth of the premier cotton textile industry to which the nascent indigenous enterprise was attracted by the opportunities of catering to domestic demand created by the changing conditions of the

international market after the Civil War in America. There did thus appear during this phase rudiments of modern industry oriented overwhelmingly to the needs of Great Britain in particular and of the western nations in general.

There was correspondingly a great expansion of foreign trade of India. This came to reflect her changed role as a primary producer, sending out agricultural produce and other raw materials and taking in manufactures fabricated outside, often from her own raw material exports. The resulting decline in traditional industry increasingly threw craftsmen and artisans out of employ to swell the ranks of pauperized peasantry.

But agriculture had kept on groaning under the new dispensation of revenue and judicial procedures which served only to facilitate the oppression of the peasantry by landlords, moneylenders, middlemen and the like parasites. Apart from the emergence of cash crops, like cotton, in a few places, there was nowhere, in the vastness of India's agriculture, any sign of change in the traditional low productive subsistence agrarian structure. On the whole, this phase was marked by steady deterioration of agricultural conditions and indeed in the general economic position of the country.

The third and final phase of the transition under the British began with the First World War and ended with the end of their rule after the Second. This period is more remarkable for the rise of Indian nationalism and for its political progress that culminated in independence in 1947 than for any significant advancement in the economic field. However, we must note that some progress was made by the process of industrialization on account of the two wars and the grudging adoption and practice of 'discriminating protection' by the colonial Government in the inter-war years. The wars, the second much more than the first, witnessed heightened economic and industrial activity but their success in promoting industrial growth was counter-balanced by the dilapidation of the basic infra-structure of overhead facilities and services coupled with a great accumulation of industrial wear, tear and obsolescence. The discriminating protection had succeeded, however, in promoting the growth, especially during the period of the great depression, of some of the major industries of pre-independence India including the iron and steel, sugar, cement and paper industries. There was also notable growth of mining particularly of coal and iron ore during this period. Some progress was concurrently witnessed in internal and external trade, banking, insurance etc. But in the preponderant agricultural sector, no redeeming signs had as yet appeared. New cash crops had emerged, market economy had made further inroads, co-operative credit had made a beginning, and research, extension and demonstration were given some attention. But all these proved much too inadequate to stem the continuing secular deterioration of agrarian conditions all over the country. Pressure of population had kept on increasing to damage the viability of outmoded

traditional structure, while the great depression had added to the misery of the peasantry. Before the end of the phase, it became clear that Indian agriculture which had traditionally generated surpluses of grain for export could not be relied upon to meet the domestic requirements in full.

On the whole, achievements of the British rule in the economic sphere were not at all impressive. As one of the most charitable assessments of the British impact on the Indian economy concludes, "In 1939, after a hundred years of British investments, peace, order and modern commercial law, after nearly a century of modern railways, after eighty years of Indian enterprise in a vast internal market of 300 million souls, India still had an industrial establishment of only 2 million workers, a steel output of less than a million tonnes and a population which still depended for as much as 80 per cent of its livelihood on a static, over-crowded, agrarian economy. Not by any stretch of imagination can this be called a record of dynamic growth. It is simply the first sketch of a first beginning."<sup>\*</sup>

It is this economy that was called upon to contribute its utmost to the mobilization of men and materials in favour of Great Britain and her allies in the Second World War. The relentless pursuit of this overriding purpose resulted to wholesale dilapidation and obsolescence of the economic structure, including its agricultural component which failed to prevent the forgotten scourge of famine which afflicted populous Bengal in 1943.

Before anything could be done about this general dilapidation of the economy, there followed, as mentioned earlier, the partition to disrupt it beyond repair. The disruption was wholesale in character. It disrupted trade, fiscal, banking and financial structures, which had emerged to serve undivided India as a unified whole. A significant part of internal trade became external with a clear possibility of its diversion away from India. There was considerable aggravation of the balance of payments position.

More fundamental were the sudden dislocation of the transport and communication systems, the disruption of the bigger industries like jute and cotton textiles involving separation of the manufacturing processes in India from important sources of raw materials left in Pakistan. Similar was the loss of certain minerals like gypsum, salt and sulphur. Indian consumer industries suffered also the loss of sizable consumer markets in the provinces now constituting Pakistan.

Indian agriculture was likewise disrupted on account especially of disproportionate loss of area under irrigation. India's share in the production of food and commercial crops too was comparatively smaller. India became comparatively poorer also in the quality of its livestock.

In any case, India was burdened with a larger proportion of population as compared to its share in total area and a larger proportion also

---

<sup>\*</sup>Ward, Barbara, *India and the West*, Hamish Hamilton, London, 1961, p. 131.

of urban population. In addition, there were the immediate problems associated with the exchange of population on a mass scale, which in quantum and quality was unfavourable to India.

Immediately, the new Government of India had thus to address themselves to the gigantic tasks of rehabilitating nearly 20 million displaced persons and reorganizing its economic and industrial structures on a narrower base. These were accomplished to a large measure in the immediate post-independence years, during which the Government successfully ushered in the new policy based on a constitution providing for a liberal democratic rule. It proceeded further to institutionalize Central planning for economic and social development, which had to begin almost from a scratch.

### III

Planning for comprehensive social and economic development began thus in 1951. It has been continuously pursued since then on the basis mainly of quinquennial Plans. The first three Plans were successively undertaken. At the end of the Third Plan, however, the situation warranted postponement of the introduction of the fourth quinquennial Plan by 3 years, during which the process had continued on the basis of Annual Plans. The Fourth Plan was consequently undertaken from 1969 to 1974 and the Fifth Plan is now at the close of its stage of formulation.

The Plans represent a concerted effort undertaken by the Government on a massive scale. The outcome of this effort can be easily seen by comparing the position of the economy in 1951 with that of the latest year for which relevant data are available. We will take for our comparison here the period of two decades from 1950-51 to 1970-71. In the course of this period, national income, as measured in constant 1960-61 prices, increased at an annual average rate of 3.6 per cent, from Rs. 92,420 million to Rs. 1,87,550 million. It had thus more than doubled over the period. But the population too had increased during the same period at an annual average rate of 2.1 per cent, from 358 million to 540 million. Consequently, per capita income at constant prices increased at a rate of only 1.5 per cent, which is much less than half the rate of growth in the national income.

To indicate the structural change that accompanied this expansion of the economy we may refer to the sectoral distribution of the gross domestic product at factor cost measured in constant in 1960-61 prices. The relevant figures are given in Appendix, Table II. It may be noted that the figures for 1950-51 are not strictly comparable as they do not distinguish between the shares of commerce, transport and communications. Adequate idea, however, is given by the comparison between 1955-56 and 1970-71. The structural change indicated by this comparison is one of significant decrease in the relative contribution of agriculture to gross

domestic product. The corresponding increase has been shared by all the remaining sectors. The difference of 11.4 points representing the decrease in the share of agriculture is corresponded by an increase of 3.6 points in the share of manufacture, 3.4 points in the share of other services, including communications, and 1.6 points in that of construction. Substantial gains appear to have accrued also to the transport sector and to the combination of public utilities representing electricity, gas and water supply. To take a broader view of this broad structural change in the economy, it may be said that the share of primary production, including agriculture, mining and quarrying, was reduced by 11.2 points, while the secondary sector recorded a gain of 7.8 points and the tertiary sector, of the remaining 3.4 points.

A closer view indicates that the pace of growth differed considerably between different constituents of each sector in the economy. The output of agriculture increased at an annual rate of 3.3 per cent but within agriculture production of foodgrains recorded a rate of 3.5 per cent. A part of the increase in foodgrains production accrued significantly from improvement in productivity; foodgrains production per hectare increased during the period by 1.9 per cent per annum. In the industrial sector, the output of capital goods increased at a rate of 10.6 per cent per annum, as against the overall rate of 6.5 per cent.

Detailed figures of physical output for the terminal years of the period indicate a significant process of diversification of the domestic product. Growth has been the characteristic of almost all types of industries and mining. But major gains have been in the field of basic development. Irrigation potential, for example, has nearly doubled during the period and it is now estimated that nearly a half of the ultimate irrigation potential has already been harnessed. In mining, the production of coal increased from 33 million tonnes to nearly 75 million tonnes and of iron ore from 3 million tonnes to 23 million tonnes. In metallurgical industries the production increases recorded by different items over the period were from 1.7 million tonnes to 7.0 million tonnes of pig iron, from 1.5 million tonnes to 6.1 million tonnes of steel ingots, and from 1 million tonnes to 4.5 million tonnes of finished steel. Most remarkable here has been the growth of aluminium output, which increased from 4 million tonnes to 167 million tonnes.

A variety of engineering industries have come up during this period. Machinery and tools of all kinds are now produced within the country. For example, the new lines are sugar mills and cement plants; their combined production increased in terms of value from Rs. 6 million to Rs. 180 million. Railway wagons, automobiles including the new lines of motor-cycles and scooters, power driven pumps, diesel engines, bicycles and sewing machines have recorded manifold increases.

Power generation has multiplied several times and considerable pro-

gress has been made in enveloping the entire country by a unified electric grid system. Electrical engineering industries have, therefore, received a considerable boost. Production of power transformers increased from 179 thousand kva to 886 thousand kva and of electrical motors from 99 thousand h. p. to 2721 thousand h. p. Production of electric fans and lamps and a variety of electronic products, including radio receivers and television sets, has tremendously increased.

In the field of chemical and allied industries, the fertilizers have led the pace. In 1950-51, the production of nitrogen fertilizers amounted only about 9 thousand tonnes of Neptha and that of phosphatic fertilizers, 2 thousand tonnes of  $P_2O_5$ . In 1970-71 the production of the former was 830 thousand tonnes of Neptha and of the latter 229 thousand tonnes of  $P_2O_5$ .

Within textiles the traditional jute industry recorded a nominal progress. But the cotton textiles have witnessed significant expansion. Here, rayon yarn and other synthetic fabrics have grown much more rapidly; production of rayon yarn increased, for example, from about 2 thousand tonnes in 1950-51 to 98 thousand tonnes in 1970-71.

It would appear, thus, that one of the basic initial weaknesses of the economy, namely, lack of basic development, that is, the absence of capital goods industries supplying the needs of immediate and final consumer goods industries, has been overcome to a significant extent. Today, the Indian economy is much more balanced. Its production base has been greatly diversified. The scale of its activity is correspondingly larger and its content much more elaborate and complex. Its external relations too have enlarged in scale and they are different in character and in direction.

All these represent considerable achievements of Indian planning, though it is true that economic development has as yet failed to acquire self-sustaining momentum. Overall rate of 3.5 per cent economic growth cannot indeed be viewed as quite satisfactory from the point of view of the needs of the people. Even so, it appears very remarkable in the light of the odds that the process had to face in the initial stages and in comparison to what happened during the preceding period of agrarian stagnation coupled with sluggishness of industrial growth under the British rule. It is remarkable also for the fact that the effort has been pursued by the Government within the framework of a liberal democratic polity.

#### IV.

Even so, it is readily admitted that these achievements fell below the targets set by planning. For example, the First Plan was conceived as a first step towards the doubling of per capita income in real terms at the end of 25 years of continual planning in 1976. By 1971, however, per capita real income had risen only about 33 per cent and the date of its

doubling seems to have receded far into the future. The explanation of this grievous shortfall does not lie in the fact of population growth alone; it must extend to recurring acts of omissions and commissions on the part of ruling Governments wilfully committed at times in the larger interests of the nation and to pre-existing and newly emerging factors beyond their control.

What is beyond any doubt is the firm commitment of the Government to undertake the development effort on a continuing basis and on an ever-enlarging scale. This is adequately reflected in the investment outlays of the different Plans given below:

Total Plan Outlay

| <i>Plan</i>                  |           | <i>Rs. Million</i> |
|------------------------------|-----------|--------------------|
| First Five Year Plan         | (1951-56) | 38,600             |
| Second Five Year Plan        | (1956-61) | 79,720             |
| Third Five Year Plan         | (1961-66) | 129,765            |
| Three annual plans combined: | (1966-69) | 103,467            |
| Fourth Five Year Plan        | (1969-74) | 257,540            |
| Fifth Five Year Plan (Draft) | (1974-79) | 534,110            |

These outlays are expressed in current prices. A part of the rise in outlays represents inevitably the impact of price changes which have consistently maintained upward direction during the period in question. But the successive enlargements in outlays are so very sizable as to clearly indicate a progressive intensification of the development effort in real terms.

Mobilization of financial resources on such an increasing scale called for generating savings from within the economy that was characterized by generally very low levels of consumption. This was attempted from year to year with varying success. Domestic savings measured somewhat less than 5 per cent of the national income at the beginning of planning. This proportion rose to 8 per cent by 1955 and 12 per cent by 1964. Thereafter, it fell back 3 per cent in the difficult years of 1967 and 1968 to rise again to 10 per cent in 1971. This was supplemented by inflow of capital from outside in order to increase net investment as a proportion of national income to 8.5 per cent in 1955, 14.9 per cent in 1964, 11.6 per cent in 1967, 11.1 per cent in 1968 and also in 1971. Inflow of foreign capital into the economy had increased during the sixties to a level of 3.6 per cent of national income in 1967 but its relative importance has progressively decreased all through the subsequent years. It is in any case clear that a high level of capital formation was maintained all through planning period. This is to be admitted even while conceding that a higher rate

was indeed necessary to avoid recurring needs, difficulties and bottlenecks in the progress of development.

The manner in which the task of channelizing investment in conformity with the goals of development was handled by planning is reflected broadly in the sectoral distribution of aggregate outlays noted above. The relevant figures are given in Appendix, Table V. It must be noted in this connection that a distinguishing feature of Indian planning has been the limitation of the direct responsibility of the Government to basic development, including the infra-structure of overhead facilities and services, heavy and basic capital intensive industries and also key industries involving defence and security considerations, in the public sector. For the rest, their job evidently was one of promoting, guiding and monitoring growth and development in the private sector. The share of public sector in the aggregate Plan outlays has progressively increased for the very reason that basic development attracted priority even from the point of view of facilitating growth in the private sector. Even so, it is clear that the quantum of private sector outlays has consistently increased from less than Rs. 15 billion in the first to nearly Rs. 90 billion in the Fourth Plan and further to the proposed outlay of Rs. 162 billion in the Draft Fifth Five Year Plan.

The sectoral distribution of outlays for each successive Plans rested on the assessment of objective conditions under which the planning goals of income growth, employment generation and social justice had to be sought. In the first Plan the urgency of rehabilitating the economy, and strengthening in particular the base of food production, led to an emphasis on the agricultural sector. It was essentially a rehabilitation plan and as such it was quite successful. Thereafter, the main focus of concentration has been on industrialization and on the supporting infra-structure, where emphasis was increasingly placed on power development. Agriculture reasserted to claim high priority after especially the Third Plan when a succession of draughts had suddenly exposed its vulnerability. On the whole, it is clear that Plan priorities and the derivative sectoral distribution of investment outlays reflected a concern more with growth of gross national product than with either employment or social justice, in other words, a concern more with the size of national income than with its equitable distribution.

The course of planning so pursued has not, in any case, been an easy one. The Second Plan's concentration on the promotion of industrial sector, particularly on the rapid increase in steel making capacity, was quite sound and logical but it met with frustration in the foreign exchange crisis to which it had contributed. It was during the more difficult later half of this Plan that the easier course of the deficit financing of development process was adopted. Then followed the border war with China in the beginning of the Third Plan and the war with Pakistan towards its

end. The end of that Plan coincided with the draught in Bihar and there followed a succession of poor harvests. The worsening of the situation in the agricultural sector led to a partial industrial recession in a period of inflationary pressures induced by the persistence with deficit financing. Recovery of agriculture and the success of the new agricultural strategy in initiating the Green Revolution in parts favoured with irrigation facilities helped to launch the Fourth Plan in an atmosphere of considerable optimism. Once again, however, an unanticipated influx of refugees on a mass scale into West Bengal led to the second more successful war with Pakistan, leading inevitably to aggravation of the inflationary pressures which have continued to characterize the present economic situation.

The succession of disturbing events beyond control of planning need not excuse all the shortfalls in the achievement. Planning was taken up in a spirit of adventure and it tended to raise anticipations much above the potentialities that could, in fact, be harnessed. It is also evident that the liberal democratic political frame under which it was consistently pursued, not only left considerable scope for uncertainty but also invoked a spirit of compromise in permitting extra-economic political considerations to influence the Plan decision-making processes.

It reveals also a number of deficiencies that characterized the development effort. Most of these deficiencies relate implementation of Plans and programmes of development. It can be said, for example, that it should have been possible to operate a much better co-ordination between industrial growth and agricultural development. Further, it should have been possible to evolve a strategy of resource mobilization through more imaginative uses of fiscal, monetary, banking and financial policies in a manner that would have provided greater encouragement to generation of savings and avoided tax evasion and diversion of resources into unhealthy speculative and non-economic channels.

Criticism can be made with justification of the host of controls and regulations that were introduced for the purpose of channelizing the growth in the private sector on appropriate lines. Further, it can be deplored that adequate attention was not paid to the creation of technical and scientific capabilities within the country for handling the tasks of management in general and of project formulation and appraisal in particular. It can also be said that there was lack of co-ordination between policies of exports and imports and that in general the performance of foreign trade and exchange controls was not consistently up to the mark.

Concern with economic growth *per se* and the manner in which it was pursued appear to have resulted also in unequal sharing of the gains of development between different sections of the community. In the industrial sphere, concentration of power could not be entirely avoided, while in agriculture the gains have been unequally shared between different regions and within each region between different classes. In general, the

relatively more prosperous sections of the community were able to pre-empt the gains of development.

### V

Democratic planning remains in India a 'going concern', displaying a large measure of resilience in meeting the demands of changing times. It has shown remarkable flexibility in its approaches and strategies and has taken from time to time corrective action in the light both of its own experience and of critical public opinion which has all along been unsparing in debating the role of the Government in the process of development. Such a process of rethinking began with the experience of agricultural adversity in the middle sixties and was carried forward during the years of stagflation, when the performance of planning was viewed to be at its lowest ebb. The succeeding Green Revolution further revealed the possibility of development leading to accentuation of social inequalities. It was apparent that planning had not made any dent on the deteriorating employment situation and on the widespread incidence of mass poverty.

This reconsideration went beyond the functional aspects of planning to the need of reformulating the basic goals of development. This is well reflected in the preparation of the Draft Fifth Five-Year Plan. This Draft suggests an endeavour to highlight the goals of employment and social justice and to reduce the over-emphasis on economic growth *per se*. This document seeks to redirect the development effort in the light of an assessment of the course that the inhibiting growth of population may take. It enunciates removal of poverty and attainment of economic self-reliance as the two strategic goals of development. It spells out a long-term perspective of development up to 1986 in the light of these considerations and proposes a policy-frame for implementation, which planning has hitherto been lacking. With this, it displays its determination to consolidate the gains that have so far accrued and a sense of realism in dealing with the problems faced in administration, execution and implementation of the programmes of development.

The Draft Plan in defining its 'long-term perspective' suggests that in 1986 our population would be of the order of 705 million as compared to 547 million in 1971. Its structure would be somewhat different; proportion of infants, or of persons below 4, would decrease between these two dates from 16 to 11 per cent and that of children of 5 to 14 years in age would decrease from 26 to 23 per cent, while the corresponding increase would be from 53 to 60 per cent in the adult population and from 5 to 6 per cent in the old age group of persons above 60. It is anticipated that the proportion of the urban in the total population will advance over the period from nearly 20 to 24 per cent. With regard to employment, the perspective envisages the growth of labour force to operate during the period at a higher pace; the numerical strength of the labour force is

anticipated to increase from 170 million in 1971 and 183 million in 1974 to 248 million in 1986. The tasks of supplying the needs of 705 million persons at improved levels of living and of gainfully employing 248 million of them call for undertaking development on a scale substantially higher than the scale it has ever attained in the course of planning so far.

And at the same time, planning must realize the strategic goal of self-reliance. This goal has been emphasized ever since it was concretized by the Third Plan which said, "The aim must be to make the economy more and more self-reliant, so that it is able to support within a period of 10 to 12 years an adequate scale of investment from its own production and savings. Normal flow of capital may continue but reliance on special forms of external assistance has to be reduced progressively and eliminated." The Draft Plan envisages to achieve this aim over the next 12 years by 1986 and emphasizes that what it seeks "is a dynamic self-reliance where the rate of growth is accelerated, while, at the same time, developing the capability to sustain it essentially from our own resources. It is thus envisaged that by 1985-86 economic growth would be basically self-sustaining at a rate of 6.2 per cent per annum, which would be the highest ever attained by the economy on a sustained basis."

On the other strategic goal of removal of poverty, which too magnifies the size of development effort, the Draft Plan is equally emphatic. "The existence of poverty," it says, "is incompatible with the vision of an advanced, prosperous, democratic, egalitarian and just society implied in the concept of a socialist pattern of development. In fact, it holds a potential threat to the unity, integrity and independence of the country. Elimination of poverty must, therefore, have the highest priority." Elaborating its approach to the problem of poverty, the Draft Plan enunciates its development strategy as follows :

"Our professed goal of removal of poverty requires that the growth strategy must seek not only a higher rate of growth than observed in the past but also reduced inequality in the distribution of income and consumption. The composition of growth must be such as favours the rural and urban poor. This calls for efforts in several directions. The pattern of production must lay emphasis on food and other articles of mass consumption. There must be massive employment generation which will sustain and will be sustained by greater availability of wage goods. It is also essential to augment social consumption and investment with a view to maximizing the efficiency and productivity of vast numbers as well as to improve the quality of their life. The institutional reform and the fiscal policy must be oriented to reduced inequality alongside increased productivity. The backward regions and classes have a high incidence of poverty. Their development must receive high priority. Every effort must be undertaken to carry family planning to the strata who need it most.

"In India, poverty is too big and complex, a problem to be overcome within the span of a single Five-Year Plan. But the compulsions of the present situation dictate that the Fifth Plan should be so oriented as to speed up the process of removing poverty and fulfilling people's expectations. In situations involving massive under-utilization of human resources, a higher growth rate and an increased equality in terms of consumption are mutually compatible objectives if planning and implementation are conceived along appropriate lines. The postulated rate and pattern of growth, the concern for freeing the development process from dependence on foreign aid, the stress on a more effective and integrated population policy, the emphasis on employment opportunities, the provision for a National Programme of Minimum Needs, the accent on uplift of backward classes and development of backward regions, and the envisaged public procurement and distribution system to ensure availability of essential goods to the poorer sections of the population at reasonably stable prices have all been conceived as mutually reinforcing instrument of policy. Removal of poverty over a reasonable period of time is thus a key task which the country must accomplish well within the perspective period."

## VI

The Fifth Plan is conceived as the first definitive phase of progress on the path of ushering in a self-reliant poverty-free economy by the end of the perspective period terminating in 1986. The Plan's target is to secure during the next five years a rate of growth of five and a half per cent, which is higher than the rate at which the economy has grown over the Fourth Plan.

The Draft duly recognizes that the absence of a policy-frame indicating co-ordination between instruments and targets had resulted in the past in "less-than-full achievements in the targets and, devises a policy frame presumably as an integrated part of the Plan. The need for this policy-frame derives justification from two specific anomalies of the prevailing situation, namely, the growing incidence of structural disproportionalities on the production side and the existence of a highly skewed distribution of property rights. Accordingly, it takes into account both the long-term objectives of development and the short-term needs of dealing with a host of problems like the accentuation of the inflationary spiral and under-utilization of productive capacities occasioned especially by paucity of external finance required for procuring inventories. Specifying the nature of policy actions required the Draft Plan notes :

"Instruments of economic policy must consequently cover a wider ground. They fall into four major categories: (a) appropriate allocations of investment outlays to different heads of development in the

plans drawn up for the various public agencies; (b) a package of measures consisting of incentives and disincentives designed to direct the flow of private investment into preferred uses and away from areas of low social profitability; (c) institutional reforms which will release productive forces which would otherwise lie dormant, leading to higher levels of production, and a more equal distribution of the benefits of extra production, and (d) finally, a set of measures which may be described as fiscal and monetary in character which can help the process of development to be carried out in a non-inflationary manner while minimizing the need for administrative actions, wherever they may tend to create unintended distortions in the resource allocation process."

This enunciation of policy measures may be taken to reflect a sense of realism which planning has begun to display in taking note of the needs of the broad masses of people. It remains to hope that this sense of realism will lead to more effective and efficient implementation of development programmes and that shortfalls in the achievement of targets will not recur so frequently as in the past. It is possible that confidence is replacing mere enthusiasm in India's endeavour to develop.

**Industrial Revolution**, spread of, 831

**Industrial Sector**: acceleration of, 86; achievements during the Plans, 36; Act of 1951, 493-495; annual exports of British capital to India, 472-473; annual imports of machinery and mill-work 1899-1939, statistics on, 485; **Atkinson-Dawson Commi-**

tee, 458; banks assistance to, 600-601; Bengal Iron Works at Barakar (1876), Tata's role, 451-452; Chatfield Committee's recommendations of, 479; contribution of small scale sector in selected, 698-700; development councils, setting up of, 494; development in the 19th century, 447; dividends as per cent of ordinary capital statistics on, 474-475; effects of protection, 470; emergence of, 181; employment in protected, (1923 and 1937), 470; evaluation of the post-independence policy of, 517-525; expenditure during the Plans, 597; external capital, 470-471; failure of Heath's pioneer attempt in 1824, 451; Government purchases during the World War II, 479; growth of, 33, 525-541; Imperial preference, suggestions on, 466; import control (1942), introduction of, 478; import duties, abolition of, 456-457, annual revenue of, (1909-1910) to (1913-14), 466, raising of (1964, 1965), 516; import prices (1929-30 and 1936-37), index of, 484-485; Inchcape Committee on retrenchment, 462-463; Indian National Congress, Calcutta session (1901), resolution of, 408; indigenous articles, 450-451; Industrial Trust Fund (1929) in Hyderabad, 464; Interim Tariff Board, setting up of, 480, recommendations of, 481-484; list of protected industries, (1970), 686; machine tools production, 476; Mahalanobis Committee Report (1960), observations of, 520-521; major role,

Bombay Industrialists Plan, 488, Congress National Planning, 488, Gandhian Plan, 488, report of the Advisory Planning Board, 488, Royist People's Plan, 498, Visvesvarayya's pioneering essay on planning, 488; Montagu-Chelmsford Report, 464-465; Morison Committee Report, 458; Morley Despatch of 1910, 455; Munitions Boards, 458-459, 479; other, protection to, 469; philosophy of *laissez-faire* in British India, 448-449; Plan outlay, 22, 24, 495-500, 503-514; policy, (1916-39), 458-461; pre-independence, 483-484; since independence, 487-489; under the British Crown, 488-489; policy of protection, 446, 449-452, 464-469, 492; post-war difficulties, 461-463; post-war industrial policy, 479-482; Princely States, 484, 517; progress in the first two Plans, 525; revival of, 30; Resources Committee, 479; Roger Mission of 1940-41, 479; Second World War, 473-474; setback in the growth, 527-528; State enterprises, 463-464, Tamil Nadu's role, 455; stores purchase policy of the British, 449-450; Swadeshi movement, 454; tariff policy, principles of, 456-457, recommendations of, 468, 849-852; Tata's role, 452; tempo of, 197; unbalanced and inadequate growth in 1939, 471-478

Inland water transport, canals connecting Calcutta, 748-749; Damodar Canal, role of, 749; Ganga Water Transport Board, 746-748; Godavari and Krishna

- rivers' role, 750-751; Gujarat and Maharashtra, 755-756; Hooghly, discussion on, 748; importance of, 86, 742-743; Indian Water Transport Conference (1951), 746; Inland Water Transport Committee, 754, 756; Kerala Waterways, 753-755; length of (1890-91), 743-744; Mahanadi and Orissa canals, role of, 749-750; North-East India, 744-746; present state of, 756-757; Rajasthan canal, role of, 756; role of Buckingham Canal, 751-753; Sunderbans, 748; Vedaranniyam Canal, role of, 753
- Insurance, 889-892; early data on investments by, 598; Government's total investment, 571-572; historical review of, 868; Insurance Act 1938, 891; Insurance Amendment Bill, 889; Life Insurance Companies Act, 889; Life Insurance Corporation of India, 871, capital underwritten, 892, investment of, 602, 889-890, nationalization of, 871, 889, role of, 30, 31, 568, 571, 889-890, 598. State-wise and sector-wise distribution, 603, total business of, 889, types of assets, 891
- Intensive cultivation, development of irrigation for, 322-323; under the Plans, 322-323
- International Monetary Fund, 26, 1000; India's membership of, 1001
- Iraq, land utilization in, 217
- Iron and Steel, annual production of pig iron in 1901, 452; Bengal Iron Works at Barakar, Tata's role, 451-452; East Indian Iron Works (1853 and 1876), failure of Heath's pioneer attempt in, 451; plants, Bhilai, Bokaro, Durgapur, Rourkela, 425, output of, 426; policy of protection, 466; production of, 20, 476; projects, Chittaranjan Locomotive Works, expansion of, 496; Raj Committee Report on steel prices and distribution, 516; Tariff Board verdict on, 467; Tata Iron & Steel Company (T.I.S.C.O.), establishment of, 407, 425, role of, 451-458
- Iron Ore, background of, 424-425; deposits of, 60, 426; expansion and modernization of, 425-426; exports of, 427; Indian Iron & Steel Co. (I.I.S.C.O.), 425; mines, pattern of development, 428, resources of, 426; output of, 426
- Irrigation-advisory panel on, 236-237; allocation in the Plans, 22, 24, 28; area under pre-Plan period, 85; Beasagar (near Bhilsa in Gwalior), irrigation system in, 219; Bhakra Nangal, water rates in, 235; canals and tube-wells, progress in the construction of, 222; Central Water, and Power Research station at Poona, 237; Conference of Commissioners of Agricultural Production (1969), recommendations of, 227; costs of, 231, 234; development of, 82-89; dug-wells, (1970-71), construction of, 224; early history of, 218-219; electric pump sets (1970-71), installation of, 224; existing problems of, 235-236; functions of, 218-219; future programme for, 48, 91; Grand Amicut, construction of, 219; ground-

- water resources, 222; Ground Water Board, 226-227; Hirakud Project, water rates in, 235; improvement in quality of, 49-50; in (1950-51) and (1967-68), 220; Irrigation Commission (1901), 219, of (1903), 221, 239, of (1969-72), 42, 80; large-scale development of, 86; Minor Irrigation Corporation, 238; masonry dam, 219; Mohanjodaro, 219; Nagarjunasagar Project, costs of, 234; policy of, 235; progress of, 222, 224, 226; potentiality of, 221-222; programme and scheme of, 224, 226; projects, 53-54; proportion of, 46; rates, 234-235; research in, 237; source-wise, 225, 227-230; special fund for, 238-239; surface water, resources of, 54, 221-222, under the Plans, 221; 221; system, 83-85, 219; tube-wells, installation (1970-71) of, 224; Tungabhadra High Level Canal, 234; works, classification of, 221
- Israel, land utilization in, 217
- Italy, fish consumption, 368
- Jaintia Garo, red soils in, 208
- Jammu and Kashmir, area under high-yielding varieties, 280; coal fields in, 421; crop diseases in, 289; forests in, 61; hydro-electric project, 111; irrigation works in, 83; land ceiling in, 258; landless cultivators in, 305; progress of consolidation of holdings in, 266; rainfall in (1970-71), 220; rice in, 231
- Japan, land utilization in, 217
- Jyoti (donation of life), 259
- Jogindernagar, role in power development, 100
- "Joint" Sector, concept of, 524-525, 612
- Joint stock companies, encouragement of, 490; growth of, 867; (1921-22), paid-up capital of, 867
- Joint ventures, share capital of, 570; significance of, 570
- Jute industry (post-war years), profits in, 472
- Karnataka (Mysore)-Agriculture Refinance Corporation, facilities in, 176; auxiliary units in, 535; black soils in, 207; coastal and interior, rainfall in 1970-71, 220; crop mixture in, 274; fish production, 369; Hindustan Aircraft Factory, Bangalore, 482, 720; hydel potential of, 112; hydro-electric project, 111; industries in, 517; iron and steel works in (1923), 1182; iron ores percentage, 427; irrigation works in, 84; land ceiling in, 258; laterite soils in, 208; manganese ore in, 406; Mysore Tenancy Agricultural Land Committee, 257; progress of consolidation of holdings in, 266; rainfall in (1970-71), 220; red soils in, 208; rerolling mills in, 507; sugarcane in, 231
- Kathiawar, setting up of cotton mills in, 464
- Kautilya, on minerals, 405
- Kerala-average size of agricultural holdings in, 264; fish production in, 64, 369; foodgrains in, 231; important crop mixture, 274; land ceiling in, 258, 261; laterite soils in, 208; monazite sands of, 117; power station at, 111; rainfall in 1970-71, 220; rerolling mills in, 507; thorium reserves in, 59; topography and

- climate of, 44; variety of forests, 61
- Keynes, J.M., 869
- Khadi and Village industries, employment, 537; growth of, 536-538; Khadi and Village Industries Board, programme of, 536-537; Khadi and Village Industries Commission, objectives of, 537-538; total production of, 537
- Kolar Gold Mines, 109; power supply for, 99
- Konkan, rainfall in 1970-71, 220
- Kotah, nuclear power station, at 55
- Kottayam (Kerala), milk plant at, 364
- Krishna, alluvial soils in, 205
- Kuttand in Kerala, saline soil in, 209
- Lacative Islands, fish production in, 369
- Labour and Employment, and the Plans, 1094-1095; bank employees, service conditions of, 1106; Bonus Commission, recommendations of, 1102-1103; Central Government employees 1104-1106; coal mines, 1103-1104; code discipline in Industry, 1096-1127; Constitution of India on, 1081-1082; disputes, 1092-1093; Disputes Act of 1947, 1093-1094; Disputes Act of 1950, 1095; employees organization, 1097; Employees' State Insurance Scheme, 1108-1109; employment pattern and policy, 1085-1088; employment service 1090-1091; Factories Act of 1881 and 1891, 1076; Family Pension Scheme, 1109; gratuity, 1125; housing facilities, 1115-1117; India and the I.L.O., 1122-1125; Industrial Statistics Act of 1942, I.L.O.'s recommendations of, 1078-1079; Industrial Truce Resolution, 1081; Integrated Social Security, 1110; lay-off and retrenchment benefits, 1110; leave and holidays, 1112-1113; membership of the trade union organization, 1098; National Labour Commission, 1085; policy before and after independence, 1076-1085; policy in the Five Year Plans, 1083-1084; protective legislation of, 1109-1110; Royal Commission's recommendations of, 1077, 1111; Shops and Commercial Establishment Act and Labour Welfare Fund Acts in States, 1085; wage plans, 1100-1102; wages and social security, 1099-1100; workers' organizations of, 1098; workers' participation in management and worker's education, 1096-1097; working and living conditions of, 1110-1111; working hours, 1112; working journalists, 1106
- Land, 44-52; Bombay Land Improvement Scheme Act, objectives of, 242-243; Central Land Development Bank, 238; cultivable waste, 47-48, 50, 213; cultivation, 49; current fallow, 213-214; District Land Improvement Committees, 242-243; grazing, 213; intermediaries, abolition of, 248, 250, compensation for, 250-251; Land Improvements Loans Act of 1883, 159; Land Improvement Schemes Act of 1942, 242; Land Management Legislation, 260-263; pattern, on the eve of inde-

- pendence, 248-249; policy of, 249-250; reclamation operation, 48, 214; redistribution of, 257; rent, regulation of, 255-256; revenue policies, defects of, 1; settlement projects, 257; State Land Improvement Boards, 242-243; Survey Committee, 213; Survey Organization, 246
- Land ceiling legislation, 258
- Land reforms, 48; aspects of, 314; Central Land Reforms Committee, recommendations of, 15, 257, 261-262; Land Reforms Panel Committee, 265; in post-independence era, 249
- Land revenue administration, system of, 42
- Land tenancy reforms, 252-254
- Land tenure reforms, ownership rights for tenants, 256; resumption of, 254
- Land utilization, 45-46, 48-50, 210-213; (1950-51, 1968-69), data on, 211, 215; Agricultural Ministry's Working Group on, 47
- Lignite, deposits of, 423; exploration of, 424; output of, 424; projects, Briquetting and Carbonization plant, 424
- Limestone, 60, deposits of, 61
- Liquors, production of, 476
- Livestock, animal health, 362; breeds and breedings, 356, variety of, 47; buffalo development, 360; cattle breeding policy, 359; cattle prices, 356-357; dairy animals, 354-355; details of the work animals, 354; development under the Plans, 357-358; feed and fodder development, 361-362; growth of research institutes, 363; intensive cattle development, introduction of, 357-362; marketing of, 362; piggery development, 361; poultry development, 361; sheep and goat development, 360-361; in urban and rural areas, 353; (1945-46), statistics on, 352-353
- Madhya Pradesh, area under high-yielding varieties, 280; bauxite deposits in, 60; coal fields in, 56, 421; coal production in, 105; cotton crop in, 231; crop mixture in, 274; foodgrains in, 231; forests in, 61; industry in, 517; iron ore deposits in, 60; irrigation works in, 84; land ceiling in, 258; land management legislation in, 261; land tenure legislation in, 254; laterite soils in, 208; pilot projects in, 246; progress of consolidation of holdings, 266; prospects for aluminium production in, 60; rainfall in (1970-71), 220; red and black soils in, 207-208; rolling mills in, 507; resumption of land for personal cultivation in 255; rice growing in, 331; trends in land utilization in, 48; weed infestation in, 51; yield of wheat in, 46-47
- Mahalanobis Committee on Distribution of Income and Levels of Living Report (1964), 578
- Maharashtra, alkali and saline soils in, 209; area under high-yielding varieties, 280; bauxite deposits in, 60; coal fields in, 421; cotton crop, 231; fish production in, 369; foodgrains in, 231; forest cooperatives societies in, 187; grazing land in, 213; important crop mixture in, 274; irrigation

- works in, 84; iron ore deposits, 60; land ceiling in, 258; progress of consolidation of holdings, 266; rainfall in 1970-71, 220; red soils in, 208; rerolling mills in, 507; sugar-cane in, 231; use of iron-ploughs in, 293
- Managing Agency system, abolition of, 565-566; appraisal of, 562-584; drawbacks of, 549-550; Managing Agency Commission, 549; mixed blessings of, 549; Monopolies Inquiry Commission, decision on, 565**

- Public Financial Institutions, and Dutt Committee report, 589-590
- Punjab-Agricultural Refinance Corporation, 176; alkaline and saline soils in, 209; alluvial soils in, 205, 207; cotton crops in, 231; crop diseases in, 788; crop mixture in, 274; desert soils in, 209; first cooperative society in 1891, 159; foodgrains in, 231; irrigation works in, 84; land ceiling in, 258; level of ceiling in, 261; oil exploration in, 432; power stations, inauguration of, 110; rice in, 231; use of chaff-cutters in, 293, use of power-threshers in, 293; water-logging in, 50; wheat production in, 231; yield of wheat, 46-47
- Rents, agricultural rents, factor of,

- 1013-1014; magnitudes of, 1018-1019; mechanism for, 1014-1016; share cropping rents, 1016-1018; Revenue Courts, 1014-1015; urban machinery, 1022-1023
- Rivers, Brahmaputra, 742; Cauvery, 77; Chambal, 111; Damodar, 77; Ganga, 77, 742, 744; Godavari, 77, 206, 742, 750; Hooghly, 742; Kaveri, 203, 742; Krishna, 742, 750; Mahanadi, 111, 742; Narmada, 142, 205, 755; nature of, 45; Roopnarayan, 749; systems and basins, 77-82; Tapti, 77, 205, 240, 742, 755**
- Roads-Border Roads, formation of Development Board, 735; classification of, 729-730; development of, 729-730; during the British rule, 727-728; expenditure on, 740-741; factors in stimulating the construction of, 728-729; increase in the surface and unsurfaced kilometrage of, (1951-1958), 734; Indian Road Development Committee of 1929 (Jayakar Committee), recommendations of, 730-731; kilometrage during the Plan periods, 736; mileage in British India (1901-1902), 730; Nagpur Plan, recommendations of, 732-733; National Highways, discussion on, 733; procedure for financing of, 731-732; revenues from 741; Road Fund, 733; Road Wings, creation of, 733; transport, 736-738, Inter-State Transport Commission on, 739-740, policy for, 738-739, progress under the Plan, 740-741**
- Rourkela, sintering plants at, 429**
- Rudrasagar, discovery of oil in, 433**
- Rural and Urban household industry, growth of, 539-541; workers engaged in, 539**
- Salt-industry, recovery of by-products in, 61**
- Sampattidan*, donations of money or other resources, 259**
- Sandal-wood oil industry, in Mysore, 464**
- Sandur, manganese ore in, 406**
- Saurashtra, industry in, 517; rainfall in, 220; use of iron-ploughs in, 297**
- Scheduled Castes and Scheduled Tribes, emphasis on, 7-9; Scheduled Tribes Commission (1960), 397; welfare of, 31**
- Science and Technology, advancement in, 8, 39, 203**
- Sea, resources, potential exploitation, 63-64; water desalination of, 55**
- Seeds, All-India Seed Certification Seminar, recommendations of, 278; broadcasting of, 275; Central Seeds Certification Board, 277-278; distribution of, 277-278; improvement of, 276-278, 282; multiplication, 277; National Seeds Corporation, 277; Seed Review Team Report (1968), 277; Seeds Act, 278; Tarai Development Corporation (1970), 277; tillage practices, object of, 278**
- Settlement Reports, 42, 43, 203**
- Shipping, British Indian Steam Navigation Company (BISN), 760; Development Fund for, 767, 768; discrimination against, 759; during the inter-war period, 759-760; historical background,**

- 757-759; Indian Mercantile Marine Training Ship "Dufferin", establishment of (1927), 762; Merchant Shipping Act of 1958, 767; Persia Steam Navigation Company, 764; Post-War Policy, 762-764; Progress under the Five Year Plans, 765-766; Reconstruction Policy Subcommittee's recommendations on, 763; Sailing Vessels Traffic Development Committee's recommendations on, 766-767; Scindia Steam Navigation Company Ltd., (1919), 759; Shipping Corporation of India Ltd., 764; Shipyard, construction of, 768-769, Cochin, 769, Hindustan Shipyard Ltd., 768, at Visakhapatnam, 768; terms of financial aid to, 764-765; Tripartite Agreement between the BISN and Scindia and the Asiatic Companies, 761-762; Western Shipping Corporation, 764
- Sibsagar, discovery of oil in, 433
- Singhbhum, manganese ore in, 406
- Small farmers, problems of, 174; Small Farmers' Development Agencies, 174, 313
- Small Scale Sectors, bank credit to, 600-601; contribution of, 698-700; development of, 498-499; cottage industries, encouragement of, 2; employment given by, 532; exemption of, 524; exports, 534; financial assistance from NSIC and State Bank and State Financial Corporations, 534; growth of, 21, 531-532; investment in, 532; socio-economic importance of, 532; hire-purchase assistance, state/territory-wise, 533; impetus given during the Third Plan, 29-30; import licensing for, 530-531; items purchased by Government from, 533; National Small Industries Corporation, 21, 534; policy of, 524; promotion of, 49; registered factory segment, progress of, 701-702; statistics on, 533
- Social Services, allocation in the Plans, 22, 24, 28
- Soil, alkali, 209; alluvial 45, 203, 205-207; black, 45, 207; classification of, 45, 203-207; desert, 209; forests, covering area of, 209; group of, 205-207, extent of area of, 206; laterite, 204, 208; ravine reclamation, objective of, 246; red soils, problem of, 203-207, 244; saline, 209; Soil and Land Use Survey, 43
- Soil Conservation, All-India Soil Survey Scheme (1956), 204; American soil conservation specialists, 241; Central Soil Conservation Board, 204, 243-244; Central Soil Mechanics Concrete Research Station, Delhi, 237; Gusrow Walia Fund, creation of 242; early history of, 239-241; expenditure on, 245; Five Year Plan role, 242, 245; (Hydrology and Sedimentation), (1970), functions of, 247; Kotah, research and training programmes for soil conservation, 243; legislation on, 242-243; Model Soil Conservation Bill, on the lines of U.S., 242-245; research and training programmes for, 243-244; Resources Inventory Centre, establishment of, 246-247; training and education programmes in 241-242

- Soil erosion, menace of, 241;  
Planning Commission, recommendations of, 245; Watershed Work Plans, 245
- South Assam (including Nagaland, Manipur and Tripura) rainfall in 1970-71, 220
- Sri Lanka, fish consumption in, 368
- State *Dans*, 259
- State financial corporations, genesis of, 626-627; regional or branch offices of, 627; sources of finance of, 628-629;
- Stock exchanges, Ahmadabad and Stock Broker's Association (1894), 892; Bombay (1887), 867, 892; Calcutta Stock Exchange Association (1908), 892, development during the First and the Second War, 392; classification of, 893; functions, 893-895; historical review of, 892; index number of variable dividend, 894; Industry-wise composition of, 893-894; legislation, 892-893; market for, 894; paid-up capital of, 893; pattern of ownership of, 894; securities, 893
- Sugar industry, factories, 469, heavy import duty on, 469; policy of protection, 469; production of, 469; in 1939 and 1945, 477; Tariff Board's recommendations, 469
- Sulphur industry, abolition of import duty on, 469; deficiency, 61; Tariff Board's recommendations, 469
- Surat, commercial city of, 240; population of, 240
- Survey and mapping techniques, modern, need for greater use of-44
- Surveys, of Bengal, 42; cadastral, 42, 67; energy, 44, 55-60; of forests, 62; geological, 42; 68; groundwater, 43; of India, 42; of Indian agencies for, 42-44; of irrigation potential, 42; of modern techniques for, 43-44; of natural resources, 43; of soil erosion, 55; trigonometric, 42; of topographic, 43; of water resources, 43
- Survey of India, 42-43
- Swadeshi movement, launching of, 454
- Switzerland, fish consumption in, 368
- Taccavi loans, procedures for distribution and recovery of, 297
- Taiwan, farmers of, 218
- Tamil Nadu (Madras), Agricultural Refinance Corporation, 176; area under high-yielding varieties, 280; auxiliary units in, 535; black and red soils in, 207-208; concentration of handlooms in, 538; Cooperative Societies Act 1932, 398; crop mixture in, 274; financial corporation in, 627; Fiska development schemes, 160; fish production, 369; foodgrains in, 231; iron-ore deposits, 60; irrigation works in, 84; land ceiling in, 258; landless labourers in, 305; level of ceiling, 261; lignite deposits in, 57; Neyveli lignite

- deposits of, 424; power station, 107; rainfall in (1970-71), 220; reduction of ceiling of land-holdings, 261; regulation of land rent in, 255; rerolling mills in, 507; rice in (1967-68), 231; sugar-cane in, 231; uranium reserves in, 59
- Tarapur, nuclear power stations located at, 55
- Tatas, role in power development, 100
- Taxation Enquiry Commission (1953-54), 596
- Taxila, ruins of, 240
- Telangana, rainfall in 1970-71, 220
- Telegraphs, progress of, 816-817; role and functions of, 815-816; traffic, local and foreign, 816; under the Plans, 818
- Telephones, history of, 819-820; International Telex, 822; manufacture of equipment, 822; overseas communication, 823-824; "Phoncom" service, 821; progress under the Five Year Plans, 820-821; "Shared Phone Service", 821; teleprinter exchanges (Telex), introduction of, 821-822; teleprinter production, 822
- Thermal power, 104, 105; average gross inefficiency of, 108; costs of, 108; development during the Plans, 107
- Thermal power stations, Bandol, 108; Barauni, 114; Bokaro, 107; Chandrapura, 108; Durgapur, 108; Ennore (Madras), 114; Karanpura coal fields, 108; Kothagungan, 108; Neyveli, 108; Obra, 108; Paner Valley Collieries, 108; Patratu, 108; Ramagundam, 108; Santaldih, 108; Satpura, 108; Singrauli collieries, 108; Trombay, 114
- Thorium, nuclear fuel potential, 59; reserves of, 59
- Timber and other industry wood, statistics on, 62
- Toofan Gramdan, 259
- Topography of India, 76-77
- Tourism and recreation industries, forest development plan, 63
- Trade and Commerce, account of, 838-844; analysis of, 838-844; annual percentage increase of exports and imports of raw and manufactured materials, 832; direction of, 844-847; evolution before independence, 831-835; evolution after independence, 835-837; exports and imports, 835-836; Export Promotion Council, 839; impact of the Five Year Plans, 836-837; Imperial Trade Preference and the Trade Agreements with U.K., 834; inland trade defects of 831, movement of commodities by rail, 828-829, size and total value of, 827-829; major agricultural commodities, 201-203; percentage increase in, 831; policy of protection of, 846, 849-852; with Pakistan (1948-49), 835-836; value and quantum of, 838
- Transport and Communications, allocation in the Plans, 22, 24, 28
- Travancore, industries in, 517

- Trees and bushes, indiscriminate cutting of, 50; plantation of, 51
- Tripura, land ceiling in, 258
- UNCTAD, 200
- Union territories, agricultural workers in, 306
- Unit Trust of India (1964), role and functions of, 590, 607, 652-656, 889
- United Kingdom, economy of, 836; foreign collaboration with, 21; fish consumption per capita per year, 368; land utilization in, 214, 216
- Uranium, reserves of, 59
- U.S.A., consumption of natural materials, 39; cotton growing in, 339; direct seed rice in, 275; extension services in, 190; fish consumption in, 368; hybrid corn, increase in, 39; inland trade in, 827; United States Agency for International Development, 238
- U.S.S.R., cotton growing in, 339; land utilization in, 216; livestock population in, 352
- Uttar Pradesh, Agricultural University Experiment Station, 290; alluvial soils in, 205; cotton crops in, 231; crop disease in, 288; crop mixture in, 274; forestry soils in, 209; forests in, 61; hydro-electrical project, 111; industries in, 517; irrigation works in, 84; land ceiling in, 261; land tenure legislation, 255; landless cultivators in, 305; National Extension Blocks in, 296; Pilot projects, 246, at Etawah, 160, 190; rainfall in 1970-71, 220; ravine erosion widespread, 50; rice growing in, 331; soil defects in, 51; uranium deposits in, 118; use of power-thresher in, 293; water-logging in, 50; wheat in, 231; yield of wheat in 47
- Vidarbha, rainfall in 1970-71, 220
- Vijayanagaram, production of manganese from, 406
- Village industries, Plan outlay on, 497-499, 511, 514-515; production of, 498; setting up of State boards for handlooms, 493
- Vindhya range, river system in, 76
- Visakhapatnam, milk plants at, 364
- Wages, agricultural industrial, 1023-1025; and the Second Plan, 1029-1030; changes in money earnings, 1025-1027; changes in real wages, 1027-1029; composition of earnings, 1043-1045; in relation to other factor payments, 1031-1032
- Water, domestic and industrial heads of, survey of, 55; ground, 53; surface, 53
- Water balance, statistics on, 53
- Water logging, problem of, 50-51
- Water power resources, assessment of, 100
- Water resources, assessment of, 52-53, 75-82; Central Water and Power Commission, study of, 78; surface potential of, 79; utilization) of, 52-54, 80, 82
- Water supply, problem of, 54-55
- Welfare State, 1; definition of, 8:

- duty of, 8; pattern of, 7-10
- West Asia, locust menace in, 291
- West Bengal-alluvial soils in, 205; area under high-yielding varieties in, 280; coal-fields in, 56, 421; coking coal in, 57; crop mixture in, 275; first colliery power station in, 419; irrigation works in, 84; jute industry in, 742; land ceilings in, 258; landless cultivators in, 305; oil exploration in, 433; practice of drilling needs in, 292; rainfall in (1970-71), 220; red soils in, 208; rice growing in, 331
- West Germany, foreign collaboration with, 21
- Wheat, area-wise yields of, 47; destroyed by a big rust epidemic in 1947 and 1954, 288
- White marble, deposits of, 61
- Wild life, 61; protection of, 63
- Wild life sanctuaries, 63
- World Bank, 14, 59
- Yugoslavia, land utilization in, 214, 216
- Zamindari and Jagirdari, abolition of, 48
